Definitions of Managed Objects for the NBMA Next Hop Resolution Protocol (NHRP)

Status of this Memo

Copyright Notice

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for the Next Hop Resolution Protocol (NHRP) as defined in RFC 2332.

Table of Contents

1. Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for the Next Hop Resolution Protocol (NHRP) as defined in RFC 2332 [17].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [21].

2. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- An overall architecture, described in RFC 2571 [1].
- Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIv1 and described in STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The second version, called SMIv2, is described in STD 58, RFC 2578 [5], STD 58, RFC 2579 [6] and STD 58, RFC 2580 [7].
- Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [8]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [9] and RFC 1906 [10]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [10], RFC 2572 [11] and RFC 2574 [12].

- Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [8]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [13].

- A set of fundamental applications described in RFC 2573 [14] and the view-based access control mechanism described in RFC 2575 [15].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [16].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIv2. A MIB conforming to the SMIv1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIv2 will be converted into textual descriptions in SMIv1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

3. Structure of the MIB

The NHRP MIB contains three groups: the General Group, the Client Group, and the Server Group.

3.1. The NHRP General Group

The General Group contains objects that apply to both clients and servers -- in particular the nhrpNextIndex scalar object, the NHRP Cache Table and the NHRP Purge Request Table.

The nhrpNextIndex scalar object is used to provide unique indices for the nhprClientIndex in the nhrpClientTable and the nhrpServerIndex in the nhrpServerTable. If used consistently, this object may prevent conflicts when multiple managers attempt to create rows simultaneously in the same table.

3.1.1. The NHRP Cache Table

The NHRP Cache Table represents the internetwork layer address to NBMA address cache that is maintained by both NHRP clients and NHRP servers.

The NHRP Cache Table contains an ifIndex as part of the Index Clause. This ifIndex represents the use of a generic ifIndex, such that the value of this ifIndex SHOULD reflect a specific NBMA subnetwork related interface as determined by an implementation. For example, assuming that the NBMA subnetwork is ATM, then it is up to the implementors of this MIB to determine their own ATM interface layering (assuming compliance with the IF-MIB, RFC 2233 [18] and the ATM-MIB, RFC 2515 [19]). In other words, assuming that the NBMA subnetwork is ATM, the ifIndex in the NHRP Cache Table would represent the ifIndex containing or consisting of the VC (or shortcut) denoted by this Table entry.

The indexing scheme for the NHRP Cache Table is very similar to the MPC Ingress Cache Table and the MPS Ingress Cache Table in the

Multiprotocol Over ATM (MPOA) MIB [23]. This MIB and the MPOA MIB were designed to be complementary and non-overlapping. The MPOA MIB should also support this MIB. The MPOA MIB was designed prior to this MIB, and was designed by the LANE/MPOA Working Group in the ATM FORUM. The indexing scheme of the NHRP Cache Table (and the NHRP Server Cache Table) reflect the indexing scheme of the MPC Ingress Cache Table and the MPS Ingress Cache Table. Although, other indexing schemes could have been used for the NHRP Cache Table, a consistent indexing scheme between these tables was thought to be more advantageous from an implementation standpoint.

3.1.2. The NHRP Purge Request Table

The NHRP Purge Request Table is a way to track Purge Request Information.

3.2. The NHRP Client Group

The Client Group contains objects that only apply to NHRP clients (NHCs).

3.2.1. The NHRP Client Table

The NHRP Client Table contains entries for NHRP Next Hop Clients (NHCs) associated with this agent. Each row in the table represents a single NHC. The RequestID used in Registration requests needs to be saved to non-volatile storage. Depending upon the implementation,

this may or may not impact how the StorageType is used. For a complete description of how the Registration RequestID is used, see Section 5.2.3 of [17].

3.2.2. The NHRP Client Registration Table

The NHRP Client Registration Table contains information on registration requests which need to be maintained by the Clients. Each entry in this table represents a single registration request. Note: since the NHRP specification does not mandate a refresh algorithm, this table omits refresh information, however, this table does contain information for all the registration requests which need to be maintained by the NHRP Clients.

3.2.3. The NHRP Client NHS Table

The NHRP Client NHS Table contains the NBMA subnetwork addresses of servers configured for use by the client. By default, the agent will add an entry to this table which corresponds to the client's default router.

3.2.4. The NHRP Client Statistics Table

The NHRP Client Statistics Table contains NHRP statistics maintained by a client. These statistics include counters on requests and replies, as well as counters for errors which are encountered by the Clients.

3.3. The NHRP Server Group

The Server Group contains objects that only apply to NHRP servers (NHSes).

3.3.1. The NHRP Server Table

The NHRP Server Table contains entries for each server associated with this agent.

3.3.2. The NHRP Server Cache Table

The NHRP Server Cache Table contains additional objects that a server keeps for each entry in its cache. This table extends the NHRP Cache Table defined in the General Group.

3.3.3. The NHRP Server NHC Table

This table contains information about all the Clients known to the Servers.

3.3.4. The NHRP Server Statistics Table

The NHRP Server Statistics Table contains NHRP statistics maintained by a server. These statistics include counters on requests and replies, as well as counters for errors which are encountered by the Servers.

4. NBMA Next Hop Resolution Protocol MIB Definitions

    -- NHRP Textual Conventions
    --*****************************************************************

    NhrpGenAddr ::= TEXTUAL-CONVENTION
        STATUS      current
        DESCRIPTION
            "The value of an internetwork layer or NBMA address."
        SYNTAX      OCTET STRING (SIZE (0..64))

    nhrpObjects OBJECT IDENTIFIER ::= { nhrpMIB 1 }

    --*****************************************************************
    -- NHRP General (Client and Server) Objects
    --*****************************************************************

    nhrpGeneralObjects OBJECT IDENTIFIER ::= { nhrpObjects 1 }

    --
    --  The following scalar is to be used to
    --  provided indices for the
    --  nhrpClientTable, and/or the nhrpServerTable.
    --

    nhrpNextIndex   OBJECT-TYPE
        SYNTAX      Unsigned32
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
            "This scalar is used for creating rows in the
            nhrpClientTable and the nhrpServerTable.
            The value of this variable is a currently unused value
            for nhrpClientIndex and nhrpServerIndex.
```

```
            The value returned when reading this variable must be
            unique for the NHC's and NHS's indices associated with
            this row. Subsequent attempts to read this variable
            must return different values.

            NOTE:  this object exists in the General Group because
            it is to be used in establishing rows in the
            nhrpClientTable and the nhrpServerTable.  In other words,
            the value retrieved from this object could become the
            value of nhrpClientIndex and nhprServerIndex.

            In the situation of an agent re-initialization the value
            of this object must be saved in non-volatile storage.

            This variable will return the special value 0 if no new
            rows can be created."

   nhrpCacheEntry OBJECT-TYPE
       SYNTAX      NhrpCacheEntry
       MAX-ACCESS  not-accessible
       STATUS      current
       DESCRIPTION
           "A cached mapping between an internetwork layer address
           and an NBMA address. Entries can be created by the
           network administrator using the nhrpCacheRowStatus
           column, or they may be added dynamically based on
           protocol operation (including NHRP, SCSP, and others,
           such as ATMARP).

           When created based by NHRP protocol operations
           this entry is largely based on contents contained in
           the Client Information Entry (CIE).
```

```
            Zero or more Client Information Entries (CIEs) may be
            included in the NHRP Packet. For a complete description
            of the CIE, refer to Section 5.2.0.1 of
            RFC 2332 [17]."

           "The value of the NBMA subaddress of the next hop. If
           there is no subaddress concept for the NBMA address
           family, this value will be a zero-length OCTET STRING."
       ::= { nhrpCacheEntry 8 }

   nhrpCacheType OBJECT-TYPE
       SYNTAX      INTEGER {
                       other(1),
                       register(2),
                       resolveAuthoritative(3),
                       resoveNonauthoritative(4),
                       transit(5),
                       administrativelyAdded(6),
                       atmarp(7),
                       scsp(8)
                   }
       MAX-ACCESS  read-create
       STATUS      current
       DESCRIPTION
           "An indication of how this cache entry
           was created. The values are:

           'other(1)'                    The entry was added by some
                                         other means.

           'register(2)'                 In a server, added based on a
                                         client registration.

           'resolveAuthoritative(3)'     In a client, added based on
                                         receiving an Authoritative
                                         NHRP Resolution Reply.
```

```
            'resolveNonauthoritative(4)' In a client, added based on
                                         receiving a Nonauthoritative
                                         NHRP Resolution Reply.

            'transit(5)'                 In a transit server, added by
                                         examining a forwarded NHRP
                                         packet.

            'administrativelyAdded(6)'   In a client or server,
                                         manually added by the
                                         administrator. The
                                         StorageType of this entry is
                                         reflected in
                                         'nhrpCacheStorageType'.

            'atmarp(7)'                  The entry was added due to an
                                         ATMARP.

            'scsp(8)'                    The entry was added due to
                                         SCSP.

            When the entry is under creation using the
            nhrpCacheRowStatus column, the only value that can be
            specified by the administrator is 'administrativelyAdded'.
            Attempting to set any other value will cause an
            'inconsistentValue' error.

            The value cannot be modified once the entry is active."
        ::= { nhrpCacheEntry 9 }

    nhrpCacheState OBJECT-TYPE
        SYNTAX      INTEGER {
                        incomplete(1),
                        ackReply(2),
                        nakReply(3)
                    }
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION

            "An indication of the state of this entry. The values are:

                'incomplete(1)' The client has sent a NHRP Resolution
                                Request but has not yet received the
                                NHRP Resolution Reply.
```

```
                'ackReply(2)'   For a client or server, this is a
                                cached valid mapping.

                'nakReply(3)'   For a client or server, this is a
                                cached NAK mapping."
        ::= { nhrpCacheEntry 10 }

    nhrpCacheHoldingTimeValid OBJECT-TYPE
        SYNTAX      TruthValue
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
            "True(1) is returned if the value of
            'nhrpCacheType' is not
            'administrativelyAdded'.  Since the
            value of 'nhrpCacheType' was not
            configured by a user, the value of
            'nhrpCacheHoldingTime' is
            considered valid.  In other words, the value of
            'nhrpCacheHoldingTime' represents
            the Holding Time for the cache Entry.

            If 'nhrpCacheType has been configured by a
            user, (i.e. the value of 'nhrpCacheType' is
            'administrativelyAdded') then false(2) will be returned.
            This indicates that the value of
            'nhrpCacheHoldingTime' is undefined because this row
            could possibly be backed up in nonvolatile storage."
        ::= { nhrpCacheEntry 11 }

5. IANA Considerations

The Internet Assigned Numbers Authority (IANA) has been and continues to be responsible for maintaining the ADDRESS FAMILY NUMBERS (http://www.isi.edu/in-notes/iana/assignments/address-family-numbers) name space assignments. The IANA has placed this list in a MIB module, such that it may be imported into other MIBs. The motivation for doing this is to allow MIBs to not have to change when a new assignment is made to the ADDRESS FAMILY NUMBERS. This is very similar to the motivation behind the IANAifType-MIB.

Any additions or changes to the list of ADDRESS FAMILY NUMBERS registered via IANA will be done as they have in the past and this document does not propose any changes to the ADDRESS FAMILY NUMBERS other than to place them into a MIB, which can be found via anonymous FTP at: ftp://ftp.isi.edu/mib/ianaaddressfamilynumbers.mib.

6. Security

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The NHRP Protocol, RFC 2332 [17], Section 5.2.4.4 discusses security. There is an authentication option which should be utilized to authenticate the source and also provide data integrity to the NHRP payload. This MIB does not contain any managed objects which configure or expose security information such as that needed for NHRP authentication or data integrity.

The following items were deemed to jeopardize security and thus, were NOT added to this MIB. Items denoted as (configurable) are those which would need values. Items denoted as (read-only) are those which would provide information. Although the NHRP Protocol [17], requires or has this information, exposing it in a MIB would jeopardize the entire NBMA domain where NHRP was being used. Therefore, these items have been omitted from the MIB.

1. (configurable) enable/disable security
2. (configurable) SPI (security parameter index).
   Depending upon the implementation,
   there may be multiple SPIs, and these would
   be configurable also. For example, if the
   implementation switched to a different SPI
   after a given time.
3. (configurable) algorithm.
   The HMAC-MD5-128 is the default hash algorithm.
4. (configurable) lifetime value in seconds.
5. (read-only) key.
6. (read-only) list of users who have access
   to the above information.

7. Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

8. Acknowledgments

This document is a product of the IETF's Internetworking Over NBMA Networks (ion) Working Group.

The authors would like to thank Avri Doria (Bytex) for the first draft of the NHRP MIB and Keith McCloghrie (cisco) and David Horton (CITR) for their feedback and suggestions. Also, we would like to thank Naganand Doraswamy (Bay Networks) for assistance with the "Security Considerations" section.
