Network File System (NFS) Version 4 External Data Representation Standard (XDR) Description

Abstract

The Network File System (NFS) version 4 protocol is a distributed file system protocol that owes its heritage to NFS protocol version 2 (RFC 1094) and version 3 (RFC 1813). Unlike earlier versions, the NFS version 4 protocol supports traditional file access while integrating support for file locking and the MOUNT protocol. In addition, support for strong security (and its negotiation), COMPOUND operations, client caching, and internationalization has been added. Of course, attention has been applied to making NFS version 4 operate well in an Internet environment.

RFC 7530 formally obsoletes RFC 3530. This document, together with RFC 7530, replaces RFC 3530 as the definition of the NFS version 4 protocol.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at http://www.rfc-editor.org/info/rfc7531.

Table of Contents

1. Introduction

This document contains the External Data Representation (XDR) [RFC4506] description of the NFSv4.0 protocol [RFC7530].

2. XDR Description of NFSv4.0

The XDR description is provided in this document in a way that makes it simple for the reader to extract it into a form that is ready to compile. The reader can feed this document in the following shell script to produce the machine-readable XDR description of NFSv4.0:

```
#!/bin/sh
grep "^  *///" | sed 's?^  */// ??' | sed 's?^  *///$??'
```

That is, if the above script is stored in a file called "extract.sh", and this document is in a file called "spec.txt", then the reader can do:

```
sh extract.sh < spec.txt > nfs4_prot.x
```

The effect of the script is to remove leading white space from each line, plus a sentinel sequence of "///".

The XDR description, with the sentinel sequence, follows:

```
