Management Information Base for IP Version 6: Textual Conventions and General Group

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document is one in the series of documents that provide MIB definitions for for IP Version 6. Specifically, the IPv6 MIB textual conventions as well as the IPv6 MIB General group is defined in this document.

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the IPv6-based internets.

This document specifies a MIB module in a manner that is both compliant to the SNMPv2 SMI, and semantically identical to the peer SNMPv1 definitions.

10. Full Copyright Statement..... 38**1. The SNMPv2 Network Management Framework**

The SNMPv2 Network Management Framework presently consists of three major components. They are:

- o the SMI, described in RFC 1902 [1] - the mechanisms used for describing and naming objects for the purpose of management.
- o the MIB-II, described in RFC 1213/STD 17 [3] - the core set of managed objects for the Internet suite of protocols.
- o RFC 1157/STD 15 [4] and RFC 1905 [5] which define two versions of the protocol used for network access to managed objects.

The Framework permits new objects to be defined for the purpose of experimentation and evaluation.

1.1. Object Definitions

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) defined in the SMI. In particular, each object type is named by an OBJECT IDENTIFIER, an administratively assigned name. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the descriptor, to refer to the object type.

2. Overview

This document is the first in the series of documents that define various MIB object groups for IPv6. These groups are the basic unit of conformance: if the semantics of a group is applicable to an implementation, then it must implement all objects in that group. For example, an implementation must implement the TCP group if and only if it implements the TCP over IPv6 protocol. At minimum, implementations must implement the IPv6 General group defined in this document as well as the ICMPv6 group [9].

This document defines the IPv6 MIB textual conventions as well as the IPv6 General group which provides for the basic management of IPv6 entities and serve as the foundation for other IPv6 MIB definitions.

The IPv6 General group consists of 6 tables:

- ipv6IfTable

The IPv6 Interfaces table contains information on the entity's IPv6 interfaces.

- ipv6IfStatsTable

This table contains information on the traffic statistics of the entity's IPv6 interfaces.

- ipv6AddrPrefixTable

The IPv6 Address Prefix table contains information on Address Prefixes that are associated with the entity's IPv6 interfaces.

- ipv6AddrTable

This table contains the addressing information relevant to the entity's IPv6 interfaces.

- ipv6RouteTable

The IPv6 routing table contains an entry for each valid IPv6 unicast route that can be used for packet forwarding determination.

- ipv6NetToMediaTable

The IPv6 address translation table contain the IPv6 Address to 'physical' address equivalencies.

3. IPv6 Address Representation

The IPv6 MIB defined in this memo uses an OCTET STRING of length 16 to represent 128-bit IPv6 address in network byte- order. This approach allows to implement IPv6 MIB without requiring any changes to the SNMPv2 SMI and compliant SNMP implementations.

4. Definition of Textual Conventions

```
IPV6-TC DEFINITIONS ::= BEGIN

IMPORTS
    Integer32                FROM SNMPv2-SMI
    TEXTUAL-CONVENTION       FROM SNMPv2-TC;

-- definition of textual conventions
Ipv6Address ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "2x:"
    STATUS      current
    DESCRIPTION
        "This data type is used to model IPv6 addresses.
        This is a binary string of 16 octets in network
        byte-order."
    SYNTAX      OCTET STRING (SIZE (16))

Ipv6AddressPrefix ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "2x:"
    STATUS      current
    DESCRIPTION
        "This data type is used to model IPv6 address
        prefixes. This is a binary string of up to 16
        octets in network byte-order."
    SYNTAX      OCTET STRING (SIZE (0..16))

Ipv6AddressIfIdentifier ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "2x:"
    STATUS      current
    DESCRIPTION
        "This data type is used to model IPv6 address
        interface identifiers. This is a binary string
        of up to 8 octets in network byte-order."
    SYNTAX      OCTET STRING (SIZE (0..8))

Ipv6IfIndex ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "d"
    STATUS      current
    DESCRIPTION
        "A unique value, greater than zero for each
        internetwork-layer interface in the managed
        system. It is recommended that values are assigned
        contiguously starting from 1. The value for each
        internetwork-layer interface must remain constant
        at least from one re-initialization of the entity's
        network management system to the next"
```

```

        re-initialization."
    SYNTAX          Integer32 (1..2147483647)

Ipv6IfIndexOrZero ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "d"
    STATUS          current
    DESCRIPTION
        "This textual convention is an extension of the
        Ipv6IfIndex convention. The latter defines
        a greater than zero value used to identify an IPv6
        interface in the managed system. This extension
        permits the additional value of zero. The value
        zero is object-specific and must therefore be
        defined as part of the description of any object
        which uses this syntax. Examples of the usage of
        zero might include situations where interface was
        unknown, or when none or all interfaces need to be
        referenced."
    SYNTAX          Integer32 (0..2147483647)

END

```

DESCRIPTION

"The MIB module for entities implementing the IPv6
 protocol."
 ::= { mib-2 55 }

-- the IPv6 general group

ipv6MIBObjects OBJECT IDENTIFIER ::= { ipv6MIB 1 }

ipv6Forwarding OBJECT-TYPE

SYNTAX INTEGER {
 forwarding(1), -- acting as a router
 notForwarding(2) -- NOT acting as
 a router
 }

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"The indication of whether this entity is acting
 as an IPv6 router in respect to the forwarding of
 datagrams received by, but not addressed to, this
 entity. IPv6 routers forward datagrams. IPv6
 hosts do not (except those source-routed via the
 host).

Note that for some managed nodes, this object may
 take on only a subset of the values possible.
 Accordingly, it is appropriate for an agent to
 return a 'wrongValue' response if a management
 station attempts to change this object to an
 inappropriate value."

```
 ::= { ipv6MIBObjects 1 }

ipv6DefaultHopLimit OBJECT-TYPE
    SYNTAX      INTEGER(0..255)
    MAX-ACCESS   read-write
    STATUS       current
    DESCRIPTION
        "The default value inserted into the Hop Limit
         field of the IPv6 header of datagrams originated
         at this entity, whenever a Hop Limit value is not
         supplied by the transport layer protocol."

SYNTAX Ipv6AddressIfIdentifier
MAX-ACCESS read-write
STATUS current
DESCRIPTION

"The Interface Identifier for this interface that

is (at least) unique on the link this interface is attached to. The Interface Identifier is combined with an address prefix to form an interface address.

By default, the Interface Identifier is autoconfigured according to the rules of the link type this interface is attached to."

::= { ipv6IfEntry 6 }

ipv6IfIdentifierLength OBJECT-TYPE

SYNTAX INTEGER (0..64)

UNITS "bits"

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"The length of the Interface Identifier in bits."

::= { ipv6IfEntry 7 }

ipv6IfPhysicalAddress OBJECT-TYPE

SYNTAX PhysAddress

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The interface's physical address. For example, for an IPv6 interface attached to an 802.x link, this object normally contains a MAC address. Note that in some cases this address may differ from the address of the interface's protocol sub-layer. The interface's media-specific MIB must define the bit and byte ordering and the format of the value of this object. For interfaces which do not have such an address (e.g., a serial line), this object should contain an octet string of zero length."

::= { ipv6IfEntry 8 }

ipv6IfAdminStatus OBJECT-TYPE

SYNTAX INTEGER {
 up(1), -- ready to pass packets
 down(2)
}

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"The desired state of the interface. When a managed system initializes, all IPv6 interfaces start with ipv6IfAdminStatus in the down(2) state. As a result of either explicit management action or per configuration information retained by the managed

system, ipv6IfAdminStatus is then changed to the up(1) state (or remains in the down(2) state)."
 ::= { ipv6IfEntry 9 }

ipv6IfOperStatus OBJECT-TYPE

SYNTAX INTEGER {
 up(1), -- ready to pass packets
 down(2),
 noIfIdentifier(3), -- no interface identifier
 -- status can not be
 -- determined for some
 unknown(4), -- reason
 -- some component is
 notPresent(5) -- missing
 }

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The current operational state of the interface. The noIfIdentifier(3) state indicates that no valid Interface Identifier is assigned to the interface. This state usually indicates that the link-local interface address failed Duplicate Address Detection. If ipv6IfAdminStatus is down(2) then ipv6IfOperStatus should be down(2). If ipv6IfAdminStatus is changed to up(1) then ipv6IfOperStatus should change to up(1) if the interface is ready to transmit and receive network traffic; it should remain in the down(2) or noIfIdentifier(3) state if and only if there is a fault that prevents it from going to the up(1) state; it should remain in the notPresent(5) state if the interface has missing (typically, lower layer) components."

6. Acknowledgments

This document borrows from MIB works produced by IETF for IPv4-based internets.

We would like to thanks the following individuals for constructive and valuable comments:

Mike Daniele,
Margaret Forsythe,
Tim Hartrick,
Jean-Pierre Roch,
Juergen Schoenwaelder,
Frank Solensky,
Vivek Venkatraman.

8. Security Considerations

Certain management information defined in this MIB may be considered sensitive in some network environments.

Therefore, authentication of received SNMP requests and controlled access to management information should be employed in such environments.
