Abstract

This document defines a Two Rate Three Color Marker (trTCM), which can be used as a component in a Diffserv traffic conditioner [RFC2475, RFC2474]. The trTCM meters an IP packet stream and marks its packets based on two rates, Peak Information Rate (PIR) and Committed Information Rate (CIR), and their associated burst sizes to be either green, yellow, or red. A packet is marked red if it exceeds the PIR. Otherwise it is marked either yellow or green depending on whether it exceeds or doesn't exceed the CIR.

1. Introduction

The Two Rate Three Color Marker (trTCM) meters an IP packet stream and marks its packets either green, yellow, or red. A packet is marked red if it exceeds the Peak Information Rate (PIR). Otherwise it is marked either yellow or green depending on whether it exceeds or doesn't exceed the Committed Information Rate (CIR). The trTCM is useful, for example, for ingress policing of a service, where a peak rate needs to be enforced separately from a committed rate.

The Meter meters each packet and passes the packet and the metering result to the Marker:

The Meter operates in one of two modes. In the Color-Blind mode, the Meter assumes that the packet stream is uncolored. In the Color-Aware mode the Meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The details of the pre-coloring process, including handling of error scenarios, and how the Meter determines the color of a pre-colored packet are DS domain specific and outside the scope of this document.

The Marker (re)colors an IP packet according to the results of the Meter. The color is coded in the DS field [RFC2474] of the packet in a PHB specific manner (see section 4 for an example).

A companion document [RFC2697] describes another three color marker, called a Single Rate Three Color Marker (srTCM), where packets are marked based on a single rate and two burst sizes.

2. Configuration

The trTCM is configured by setting its mode and by assigning values to four traffic parameters: a Peak Information Rate (PIR) and its associated Peak Burst Size (PBS) and a Committed Information Rate (CIR) and its associated Committed Burst Size (CBS).

The PIR and CIR are measured in bytes of IP packets per second, i.e., it includes the IP header, but not link specific headers. The PIR must be equal to or greater than the CIR.

The PBS and the CBS are measured in bytes and both of them must be configured to be greater than 0. It is recommended that they be configured to be equal to or greater than the size of the largest possible IP packet in the stream.

3. Metering

The behavior of the Meter is specified in terms of its mode and two token buckets, P and C, with rates PIR and CIR, respectively. The maximum size of the token bucket P is PBS and the maximum size of the token bucket C is CBS.

The token buckets P and C are initially (at time 0) full, i.e., the token count $Tp(0) = PBS$ and the token count $Tc(0) = CBS$. Thereafter, the token count Tp is incremented by one PIR times per second up to PBS and the token count Tc is incremented by one CIR times per second up to CBS.

When a packet of size B bytes arrives at time t, the following happens if the trTCM is configured to operate in the Color-Blind mode:

- o If $Tp(t) - B < 0$, the packet is red, else
- o if $Tc(t) - B < 0$, the packet is yellow and Tp is decremented by B, else
- o the packet is green and both Tp and Tc are decremented by B.

When a packet of size B bytes arrives at time t, the following happens if the trTCM is configured to operate in the Color-Aware mode:

- o If the packet has been precolored as red or if $Tp(t) - B < 0$, the packet is red, else
- o if the packet has been precolored as yellow or if $Tc(t) - B < 0$, the packet is yellow and Tp is decremented by B, else
- o the packet is green and both Tp and Tc are decremented by B.

The actual implementation of a Meter doesn't need to be modeled according to the above formal specification.

4. Marking

The Marker reflects the metering result by setting the DS field of the packet to a particular codepoint. In case of the AF PHB [RFC2597], the color can be coded as the drop precedence of the packet.

5. Service Example

The trTCM can be used to mark a IP packet stream in a service, where different, decreasing levels of assurances (either absolute or relative) are given to packets which are green, yellow, or red. For example, a service may discard all red packets, because they exceeded the peak rate, forward yellow packets as best effort, and forward green packets with a low drop probability.

6. Security Considerations

The trTCM has no known security concerns.
