Definitions of Managed Objects for the Virtual Router Redundancy Protocol

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This specification defines an extension to the Management Information Base (MIB) for use with SNMP-based network management. In particular, it defines objects for configuring, monitoring, and controlling routers that employ the Virtual Router Redundancy Protocol (VRRP) [17].

This memo specifies a MIB module in a manner that is compliant with SMIV2 [5], and semantically identical to the SMIV1 definitions [2].

1. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- o An overall architecture, described in RFC 2571 [1].
- o Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIV1 and described in STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The second version, called SMIV2, is described in STD 58, RFC 2578 [5], STD 58, RFC 2579 [6] and STD 58, RFC 2580 [7].
- o Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [8]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [9] and RFC 1906 [10]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [10], RFC 2572 [11] and RFC 2574 [12].
- o Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [8]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [13].

- o A set of fundamental applications described in RFC 2573 [14] and the view-based access control mechanism described in RFC 2575 [15].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [16].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

2. Overview

This memo identifies the set of objects for configuring, monitoring, and controlling the Virtual Router Redundancy Protocol (VRRP), as defined in RFC 2338 [17].

VRRP specifies an election protocol that will allow one or more associated IP addresses to be assumed by another router in the event of a failure of the IP address(es) owner. Thus, IP traffic from a host using a failed router as a default gateway is transparently forwarded by the VRRP router that has assumed control. VRRP provides redundancy in routed networks without requiring configuration of dynamic routing or router discovery protocols on every end-host.

Since the VRRP protocol is intended for use with IPv4 routers only, this MIB uses the SYNTAX for IP addresses which is specific to IPv4. Thus, changes will be required for this MIB to interoperate in an IPv6 environment.

2.1. VRRP MIB Structure

The VRRP MIB contains three conformance groups:

- vrrpOperations Group: Objects related to VRRP router's configuration and control.
- vrrpStatistics Group: Objects containing information useful in monitoring the operation of VRRP routers.

- vrrpNotifications Group: Consists of objects and definitions for use in SNMP notifications sent by VRRP routers.

Tables in the MIB include the following:

- (1) The vrrpOperTable, which contains objects that define the operational characteristics of a VRRP router. Rows in this table correspond to instances of virtual routers.
- (2) The vrrpAssoIpAddrTable, which contains the addresses of the virtual router(s) that a given VRRP router is backing up.
- (3) The vrrpRouterStatsTable which contains the operating statistics for a VRRP router.

2.2. Virtual Router Redundancy Protocol

This MIB is based on the following characteristics of VRRP as defined in the VRRP specification [17].

- A "VRRP router" is one that is configured to run the VRRP protocol in conjunction with one or more other VRRP routers attached to a LAN.
- A VRRP router can be running one or more instances of a virtual router.
- A "virtual router" is an abstraction which consists of two or more physical routers associated by a Virtual Router Identifier (VRID).
- An instance of a virtual router (on a physical VRRP router), can be uniquely identified by a combination of the 'ifIndex' [18] and "Virtual Router Identifier" (VRID).
- For each VRID there is a set of one or more "associated IP addresses" that are backed-up by the virtual router.

2.3. VRRP MIB Table Design

The tables in the VRRP MIB are structured with the assumption that a VRRP network management application would likely be designed to display information or provide configuration about a VRRP router on a "per-virtual-router basis". Thus, the tables defined in the MIB consist of conceptual rows which are grouped in a manner to present a view of individual virtual routers with a minimal number of SNMP operations.

2.3.1. Relation to Interface Group (RFC 2233) [18].

Since a router can be participating in VRRP on one or more physical interfaces, "ifIndex" is used as an index into the tables defined in the VRRP MIB.

2.4. VRRP Scenarios

The following section provides examples of how some of the objects in this MIB are instantiated for two different VRRP scenarios.

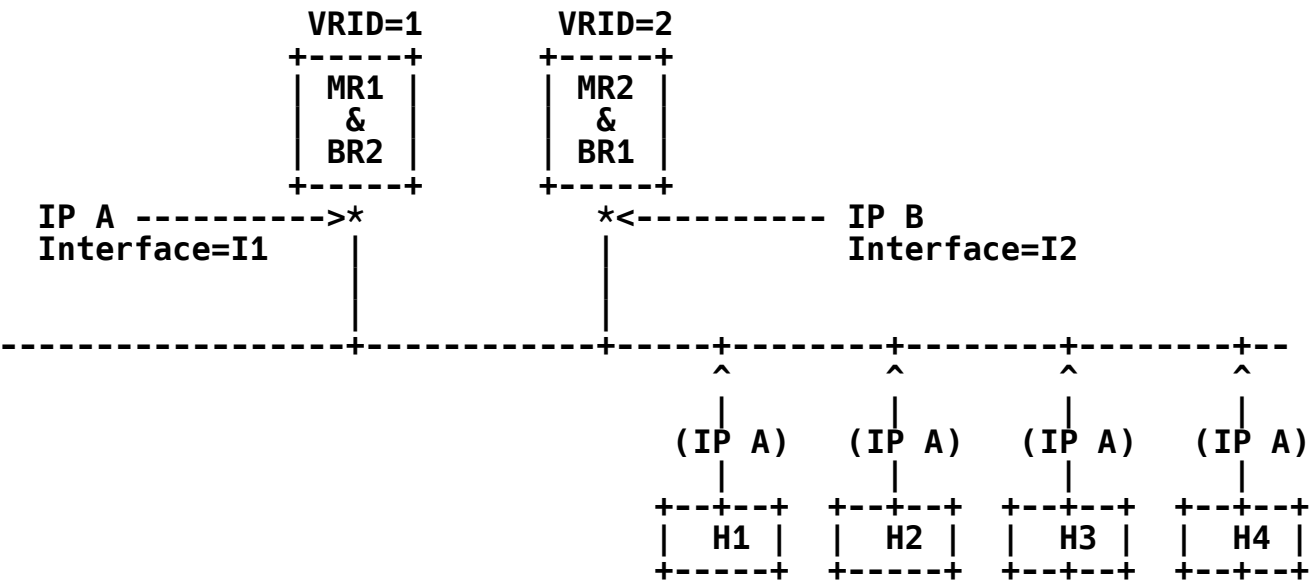

KEY:

The labels in the following tables and diagrams correspond to the actual MIB objects as follows:

if	= vrrpOperIfIndex
VrId	= vrrpOperVrId
State	= vrrpOperState
Prior	= vrrpOperPriority
AddrCnt	= vrrpOperIpAddrCount
IpAddr	= vrrpOperMasterIpAddr
RowStat	= vrrpOperRowStatus

2.4.1. VRRP Scenario #1

The following figure shows a simple network with two VRRP routers configured with two virtual routers. This sample topology is taken from the VRRP specification [17]. Addresses in '()' indicate the IP address of the default gateway for a given host, H1 - H4. In the diagram, "Interface" is used in the context defined in IF-MIB [18].

----- MIB Tables For VRRP Router "IP A": -----

vrrp0perTable

if	VrId	State	Prior	AddrCnt	IpAddr	...	RowStat
I1	01	M	255	1	A	()	active
I1	02	B	1-254	1	B	()	active
						()	

vrrpAssoIpAddrTable

if	VrId	IP	RowStat
I1	01	A	active
I1	02	B	active

----- MIB Tables For VRRP Router "IP B": -----

vrrpOperTable

if	VrId	State	Prior	AddrCnt	IpAddr	...	RowStat
I2	01	B	1-254	1	A	()	active
I2	02	M	255	1	B	()	active

vrrpAssoIpAddrTable

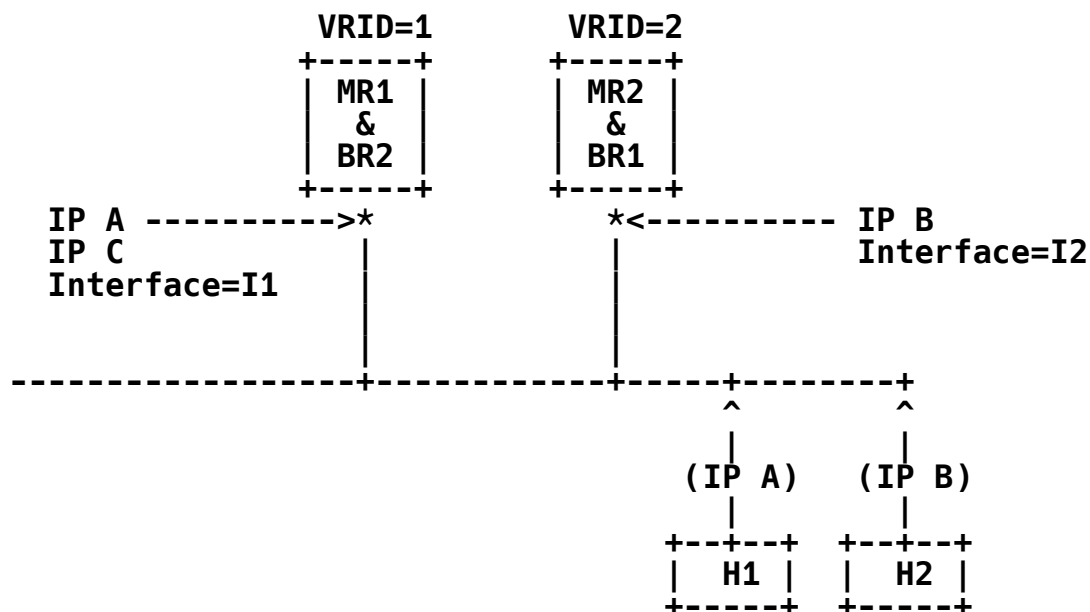

if	VrId	IP	RowStat
I2	01	A	active
I2	02	B	active

NOTES:

- 1) "I1" and "I2" are used to designate IF indices on each respective router.
- 2) For "State": M = Master; B = Backup.
- 3) In the vrrpOperTable, a "priority" of 255 indicates that the respective router owns the IP address, e.g., this IP address is native to the router (i.e., "the IP Address Owner" [17]).

2.4.2. VRRP Scenario #2

The following figure shows a simple network with two virtual routers. Here, a single interface has been configured with two IP addresses. Again, addresses in () indicate the IP address of the default gateway for a given host, H1 - H2.

----- MIB Tables For VRRP Router "IP A": -----

vrrpOperTable

if	VrId	State	Prior	AddrCnt	IpAddr	...	RowStat
I1	01	M	255	2	A	()	active
I1	02	B	1-254	1	B	()	active
						()	

vrrpAssoIpAddrTable

if	VrId	IP	RowStat
I1	01	A	active
I1	01	C	active
I1	02	B	active

----- MIB Tables For VRRP Router "IP B": -----

vrrpOperTable

if	VrId	State	Prior	AddrCnt	IpAddr	...	RowStat
I2	01	B	1-254	2	A	()	active
I2	02	M	255	1	B	()	active
						()	

vrrpAssoIpAddrTable

if	VrId	IP	RowStat
I2	01	A	active
I2	01	C	active
I2	02	B	active

    DESCRIPTION
        "The current state of the virtual router. This object has
        three defined values:
```

- 'initialize', which indicates that all the virtual router is waiting for a startup event.
- 'backup', which indicates the virtual router is monitoring the availability of the master router.
- 'master', which indicates that the virtual router is forwarding packets for IP addresses that are associated with this router.

Setting the 'vrrpOperAdminState' object (below) initiates

transitions in the value of this object."
 ::= { vrrpOperEntry 3 }

vrrpOperAdminState OBJECT-TYPE

SYNTAX INTEGER {

up(1),
 down(2)

}

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This object will enable/disable the virtual router function. Setting the value to 'up', will transition the state of the virtual router from 'initialize' to 'backup' or 'master', depending on the value of 'vrrpOperPriority'. Setting the value to 'down', will transition the router from 'master' or 'backup' to 'initialize'. State transitions may not be immediate; they sometimes depend on other factors, such as the interface (IF) state.

The 'vrrpOperAdminState' object must be set to 'down' prior to modifying the other read-create objects in the conceptual row. The value of the 'vrrpOperRowStatus' object (below) must be 'active', signifying that the conceptual row is valid (i.e., the objects are correctly set), in order for this object to be set to 'up'."

DEFVAL { down }

::= { vrrpOperEntry 4 }

vrrpOperPriority OBJECT-TYPE

SYNTAX Integer32 (0..255)

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This object specifies the priority to be used for the virtual router master election process. Higher values imply higher priority.

A priority of '0', although not settable, is sent by the master router to indicate that this router has ceased to participate in VRRP and a backup virtual router should transition to become a new master.

A priority of 255 is used for the router that owns the associated IP address(es)."

DEFVAL { 100 }

::= { vrrpOperEntry 5 }

vrrp0perIpAddrCount OBJECT-TYPE

DESCRIPTION
 "The particular protocol being controlled by this Virtual
 Router.

 New enumerations to this list can only be added via a new
 RFC on the standards track."
DEFVAL { ip }
 ::= { vrrpOperEntry 14 }

vrrpOperRowStatus OBJECT-TYPE

SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
 "The row status variable, used in accordance to installation
 and removal conventions for conceptual rows. The rowstatus of
 a currently active row in the vrrpOperTable is constrained
 by the operational state of the corresponding virtual router.
 When `vrrpOperRowStatus' is set to active(1), no other
 objects in the conceptual row, with the exception of
 `vrrpOperAdminState', can be modified. Prior to setting the
 `vrrpOperRowStatus' object from `active' to a different value,
 the `vrrpOperAdminState' object must be set to `down' and the
 `vrrpOperState' object be transitioned to `initialize'.

 To create a row in this table, a manager sets this object
 to either createAndGo(4) or createAndWait(5). Until instances
 of all corresponding columns are appropriately configured,
 the value of the corresponding instance of the `vrrpOperRowStatus'
 column will be read as notReady(3).

In particular, a newly created row cannot be made active(1) until (minimally) the corresponding instance of 'vrrpOperVrId' has been set and there is at least one active row in the 'vrrpAssoIpAddrTable' defining an associated IP address for the virtual router."

4. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write or read-create. Such objects may be considered sensitive or vulnerable to security attacks in some networking environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on VRRP router operations.

A number of objects in the vrrpOperTable possess the read-create attribute. Manipulation of these objects is capable of affecting the operation of a virtual router.

Specific examples of this include, but are not limited to:

- o The vrrpOperAdminState object which could be used to disable a virtual router.
- o The vrrpOperPrimaryIpAddress object which, if compromised, could allow assignment of an invalid IP address to a master router.

- o The authentication type/key related objects which could potentially render the VRRP security mechanisms ineffective.

Of additional concern is the ability to disable the transmission of traps. This would nullify the capability of a virtual router to provide notification in the event of an authentication failure.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model RFC 2574 [RFC2574] and the View-based Access Control Model RFC 2575 [RFC2575] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
