Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base (MIB)

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for modeling a Multiprotocol Label Switching (MPLS) [RFC3031] based traffic engineering. This MIB module should be used in conjunction with the companion document [RFC3813] for MPLS based traffic engineering configuration and management.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14, RFC 2119, reference [RFC2119].

2. Terminology

This document uses terminology from the MPLS architecture document [RFC3031] and MPLS Label Switch Router MIB [RFC3813]. Some frequently used terms are described next.

An explicitly routed LSP (ERLSP) is referred to as an MPLS tunnel. It consists of in-segment(s) and/or out-segment(s) at the egress/ingress LSRs, each segment being associated with one MPLS interface. These are also referred to as tunnel segments. Additionally, at an intermediate LSR, we model a connection as consisting of one or more in-segments and/or one or more out-segments. The binding or interconnection between in-segments and out-segments is performed using a cross-connect. These objects are defined in the MPLS Label Switch Router MIB [RFC3813].

3. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

4. Feature List

The MPLS traffic engineering MIB module is designed to satisfy the following requirements and constraints:

- The MIB module supports configuration of point-to-point unidirectional tunnels.
- MPLS tunnels need not be interfaces, but it is possible to configure a tunnel as an interface.
- The MIB module supports tunnel establishment via an MPLS signalling protocol wherein the tunnel parameters are specified using this MIB module at the head end of the LSP, and end-to-end tunnel LSP establishment is accomplished via signalling. The MIB module also supports manually configured tunnels, i.e., those for which label associations at each hop of the tunnel LSP are provisioned by the administrator via the LSR MIB [RFC3813].
- The MIB module supports persistent, as well as non-persistent tunnels.

5. Outline

Traffic engineering support for MPLS tunnels requires the following configuration:

- Setting up MPLS tunnels along with appropriate configuration parameters.
- Configuring tunnel for loose and strict source routed hops.

These actions may need to be accompanied by corresponding actions using [RFC3813] to establish and configure tunnel segments, if this is done manually. Also, the in-segment and out-segment performance tables, `mplsInSegmentPerfTable`, and `mplsOutSegmentPerfTable` [RFC3813], should be used to determine performance of the tunnels and tunnel segments, in addition to `mplsTunnelPerfTable` in this MIB module.

5.1. Summary of Traffic Engineering MIB Module

The MIB module objects for performing these actions consist of the following tables:

- Tunnel table (`mplsTunnelTable`) for setting up MPLS tunnels.
- Resource table (`mplsTunnelResourceTable`) for setting up the tunnel resources.
- Tunnel specified, actual, and computed hop tables (`mplsTunnelHopTable`, `mplsTunnelARHopTable`, and `mplsTunnelCHopTable`) for strict and loose source routed MPLS tunnel hops.
- Tunnel performance table (`mplsTunnelPerfTable`) for measuring tunnel performance.
- CRLDP resource table (`mplsTunnelCRLDPResTable`) for specifying resource objects applicable to tunnels signaled using CRLDP.

These tables are described in the subsequent sections.

6. Brief Description of MIB Objects

The objects described in this section support the functionality described in documents [RFC3209] and [RFC3212]. The tables support both manually configured and signaled tunnels.

6.1. `mplsTunnelTable`

The `mplsTunnelTable` allows new MPLS tunnels to be created between an MPLS LSR and a remote endpoint, and existing tunnels to be reconfigured or removed. Note that we only support point-to-point tunnels, although multipoint-to-point and point-to-multipoint connections are supported by an LSR acting as a cross-connect. Each MPLS tunnel can thus have one out-segment originating at an LSR and/or one in-segment terminating at that LSR.

`mplsTunnelTable` does not define the in and out segments forming the tunnel. Instead, these are defined by creating rows in the in-segment and out-segment tables, defining relationships in the cross-connect table, and referring to these rows in the `mplsTunnelTable` using a cross-connect index, `mplsTunnelXCIndex`. These segment and cross-connect related objects are defined in [RFC3813].

6.2. `mplsTunnelResourceTable`

`mplsTunnelResourceTable` is used to indicate the resources required for a tunnel. Multiple tunnels may share the same resources by pointing to the same entry in this table. Tunnels that do not share resources must point to separate entries in this table.

6.3. `mplsTunnelHopTable`

`mplsTunnelHopTable` is used to indicate the hops, strict or loose, for an MPLS tunnel defined in `mplsTunnelTable`, when it is established via signalling. Multiple tunnels may share the same hops by pointing to the same entry in this table. Each row also has a secondary index, `mplsTunnelHopIndex`, corresponding to the next hop of this tunnel. The scalar `mplsTunnelMaxHops` indicates the maximum number of hops that can be specified on each tunnel supported by this LSR.

At transit LSRs, this table contains the hops, strict or loose, that apply to the downstream part of this tunnel only. This corresponds to the requested path received through the signaling protocol.

6.4. `mplsTunnelARHopTable`

`mplsTunnelARHopTable` is used to indicate the actual hops traversed by a tunnel as reported by the MPLS signalling protocol after the tunnel is setup. The support of this table is optional since not all MPLS signalling protocols may support this feature.

At transit LSRs, this table contains the actual hops traversed by the tunnel along its entire length if that information is available. This corresponds to the recorded path reported by the MPLS signalling protocol, possibly derived from multiple signaling messages.

6.5. `mplsTunnelCHopTable`

`mplsTunnelCHopTable` lists the actual hops computed by a constraint-based routing algorithm based on the `mplsTunnelHopTable` for the MPLS signalling protocol in use. The support of this table is optional since not all implementations may support computation of hop lists using a constraint-based routing protocol.

At transit LSRs, this table contains the hops computed to apply to the downstream part of this tunnel. This corresponds to the requested path signaled from this LSR through the signaling protocol.

6.6. mplsTunnelPerfTable

mplsTunnelPerfTable provides several counters to measure the performance of the MPLS tunnels. This table augments mplsTunnelTable.

6.7. mplsTunnelCRLDPResTable

mplsTunnelCRLDPResTable contains resource information for those tunnels that are signaled using CRLDP [RFC3212]. This is a sparse extension to mplsTunnelResourceTable and is also indexed by mplsTunnelResourceIndex. As with mplsTunnelResourceTable, multiple tunnels may share the same resources by pointing to the same entry in this table. Tunnels that do not share resources must point to separate entries in this table. The mplsTunnelCRLDPResTable may be supported only by implementations that support the CR-LDP signaling protocol.

7. Use of 32-bit and 64-bit Counters

64-bit counters are provided in this MIB module for high-speed interfaces where the use of 32-bit counters might be impractical. The requirements on the use of 32-bit and 64-bit counters (copied verbatim from [RFC2863]) are as follows:

For interfaces that operate at 20,000,000 (20 million) bits per second or less, 32-bit byte and packet counters MUST be supported. For interfaces that operate faster than 20,000,000 bits/second, and slower than 650,000,000 bits/second, 32-bit packet counters MUST be supported and 64-bit octet counters MUST be supported. For interfaces that operate at 650,000,000 bits/second or faster, 64-bit packet counters AND 64-bit octet counters MUST be supported.

8. Application of the Interface Group to MPLS Tunnels

The Interfaces Group of MIB II defines generic managed objects for managing interfaces. This memo contains the media-specific extensions to the Interfaces Group for managing MPLS Tunnels as logical interfaces.

This memo assumes the interpretation of the Interfaces Group to be in accordance with [RFC2863] which states that the interfaces table (ifTable) contains information on the managed resource's interfaces and that each sub-layer below the internetwork layer of a network

interface is considered an interface. Thus, the MPLS interface is represented as an entry in the ifTable. The inter-relation of entries in the ifTable is defined by the Interfaces Stack Group defined in [RFC2863].

When using MPLS Tunnels as interfaces, the interface stack table might appear as follows:

```

+-----+
| MPLS tunnel interface ifType = mplsTunnel(150) |
+-----+
|           MPLS interface ifType = mpls(166)           |
+-----+
|                   Underlying layer                   |
+-----+

```

In the above diagram, "Underlying Layer" refers to the ifIndex of any interface type for which MPLS internetworking has been defined. Examples include ATM, Frame Relay, and Ethernet.

8.1. Support of the MPLS Tunnel Interface by ifTable

Some specific interpretations of the ifTable for those MPLS tunnels represented as interfaces follow:

Object	Use for the MPLS tunnel.
ifIndex	Each MPLS tunnel is represented by an ifEntry.
ifDescr	Description of the MPLS tunnel.
ifType	The value that is allocated for the MPLS tunnel is 150.
ifSpeed	The total bandwidth in bits per second for use by the MPLS tunnel.
ifPhysAddress	Unused.
ifAdminStatus	See [RFC2863].
ifOperStatus	This value reflects the actual operational status of the MPLS tunnel. Assumes the value down(2) if the MPLS tunnel is down.
ifLastChange	See [RFC2863].

ifInOctets	The number of octets received over the MPLS tunnel.
ifOutOctets	The number of octets transmitted over the MPLS tunnel.
ifInErrors	The number of labeled packets dropped due to uncorrectable errors.
ifInUnknownProtos	The number of received packets discarded during packet header validation, including packets with unrecognized label values.
ifOutErrors	See [RFC2863].
ifName	Textual name (unique on this system) of the MPLS tunnel or an octet string of zero length.
ifLinkUpDownTrapEnable	Default is disabled (2).
ifConnectorPresent	Set to false (2).
ifHighSpeed	See [RFC2863].
ifHCInOctets	The 64-bit version of ifInOctets; supported if required by the compliance statements in [RFC2863].
ifHCOctets	The 64-bit version of ifOutOctets; supported if required by the compliance statements in [RFC2863].
ifAlias	The non-volatile 'alias' name for the MPLS tunnel as specified by a network manager.

9. Example of Tunnel Setup

This section contains an example of which MIB objects should be modified if one would like to create a best effort, loosely routed, unidirectional traffic engineered tunnel, which spans two hops of a simple network. Note that these objects should be created on the "head-end" LSR. Those objects relevant to illustrating the relationships amongst different tables are shown here. Other objects may be needed before conceptual row activation can happen.

The RowStatus values shown in this section are those to be used in the set request, typically createAndGo(4) which is used to create the conceptual row and have its status immediately set to active. A subsequent retrieval operation on the conceptual row will return a different value, such as active(1). Please see [RFC2579] for a detailed discussion on the use of RowStatus.

In mplsTunnelResourceTable:

```
{
  mplsTunnelResourceIndex          = 5,
  mplsTunnelResourceMaxRate        = 0,
  mplsTunnelResourceMeanRate       = 0,
  mplsTunnelResourceMaxBurstSize   = 0,
  mplsTunnelResourceMeanBurstSize  = 0,
  mplsTunnelResourceExBurstSize    = 0,
  mplsTunnelResourceExBurstSize    = unspecified (1),
  mplsTunnelResourceWeight         = 0,
  -- Mandatory parameters needed to activate the row go here
  mplsTunnelResourceRowStatus      = createAndGo (4)
}
```

The next two instances of mplsTunnelHopEntry are used to denote the hops this tunnel will take across the network.

The following denotes the beginning of the tunnel, or the first hop. We have used the fictitious LSR identified by "192.168.100.1" as our example head-end router.

In mplsTunnelHopTable:

```
{
  mplsTunnelHopListIndex          = 1,
  mplsTunnelPathOptionIndex       = 1,
  mplsTunnelHopIndex              = 1,
  mplsTunnelHopAddrType           = ipv4 (1),
  mplsTunnelHopIpAddr             = "192.168.100.1",
  mplsTunnelHopIpPrefixLen        = 32,
  mplsTunnelHopType               = strict (2),
  mplsTunnelHopInclude            = true (1),
  mplsTunnelHopPathOptionName     = "Here to there",
  mplsTunnelHopEntryPathComp      = explicit (2),
  -- Mandatory parameters needed to activate the row go here
  mplsTunnelHopRowStatus          = createAndGo (4)
}
```

The following denotes the end of the tunnel, or the last hop in our example. We have used the fictitious LSR identified by "192.168.101.1" as our end router.

In mplsTunnelHopTable:

```
{
  mplsTunnelHopListIndex          = 1,
  mplsTunnelPathOptionIndex       = 1,
  mplsTunnelHopIndex              = 2,
  mplsTunnelHopAddrType           = ipv4 (1),
  mplsTunnelHopIpAddr             = "192.168.101.1",
  mplsTunnelHopIpPrefixLen        = 32,
  mplsTunnelHopType               = loose (2),
  mplsTunnelHopInclude            = true (1),
  mplsTunnelHopPathOptionName     = "Here to there",
  mplsTunnelHopEntryPathComp      = explicit (2),
  -- Mandatory parameters needed to activate the row go here
  mplsTunnelHopRowStatus          = createAndGo (4)
}
```

The following denotes the configured tunnel "head" entry:

In mplsTunnelTable:

```
{
  mplsTunnelIndex                 = 1,
  mplsTunnelInstance              = 0,
  mplsTunnelIngressLSRId          = 192.168.100.1,
  mplsTunnelEgressLSRId           = 192.168.101.1,
  mplsTunnelName                  = "My first tunnel",
  mplsTunnelDescr                 = "Here to there",
  mplsTunnelIsIf                  = true (1),
  -- RowPointer MUST point to the first accessible column
  mplsTunnelXCPointer              = 0.0,
  mplsTunnelSignallingProto        = none (1),
  mplsTunnelSetupPrio              = 0,
  mplsTunnelHoldingPrio            = 0,
  mplsTunnelSessionAttributes     = 0,
  mplsTunnelLocalProtectInUse     = false (0),
  -- RowPointer MUST point to the first accessible column
  mplsTunnelResourcePointer        = mplsTunnelResourceMaxRate.5,
  mplsTunnelInstancePriority       = 1,
  mplsTunnelHopTableIndex          = 1,
  mplsTunnelIncludeAnyAffinity     = 0,
  mplsTunnelIncludeAllAffinity     = 0,
  mplsTunnelExcludeAnyAffinity     = 0,
  mplsTunnelPathInUse              = 1,
}
```

```

    mplsTunnelRole          = head (1),
-- Mandatory parameters needed to activate the row go here
    mplsTunnelRowStatus     = createAndGo (4)
}

```

Note that any active or signaled instances of the above tunnel would appear with the same primary mplsTunnelIndex, but would have values greater than 0 for mplsTunnelInstance. They would also have other objects such as the mplsTunnelXCPointer set accordingly.

10. The Use of RowPointer

RowPointer is a textual convention used to identify a conceptual row in a conceptual table in a MIB by pointing to the first accessible object. In this MIB module, in mplsTunnelTable, the objects mplsTunnelXCPointer and mplsTunnelResourcePointer are of type RowPointer. The object mplsTunnelXCPointer points to a specific entry in the mplsXCTable [RFC3813]. This entry in the mplsXCTable is the associated LSP for the given MPLS tunnel entry. The object mplsTunnelResourcePointer points to a specific entry in a traffic parameter table. An example of such a traffic parameter table is mplsTunnelResourceTable. It indicates a specific instance of a traffic parameter entry that is associated with a given MPLS tunnel entry. These RowPointer objects MUST point to the first instance of the first accessible columnar object in the appropriate conceptual row in order to allow the manager to find the appropriate corresponding entry in either MPLS-LSR-STD-MIB [RFC3813] or MPLS-TE-STD-MIB. If object mplsTunnelXCPointer returns zeroDotZero, it implies that there is no LSP associated with that particular instance of tunnel entry. If object mplsTunnelResourcePointer returns zeroDotZero, it implies that there is no QoS resource associated with that particular instance of tunnel entry.

::= { mplsTeObjects 2 }

mplsTunnelEntry OBJECT-TYPE

SYNTAX MplsTunnelEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"An entry in this table represents an MPLS tunnel. An entry can be created by a network administrator or by an SNMP agent as instructed by an MPLS signalling protocol. Whenever a new entry is created with mplsTunnelIsIf set to true(1), then a corresponding entry is created in ifTable as well (see RFC 2863). The ifType of this entry is mplsTunnel(150).

A tunnel entry needs to be uniquely identified across a MPLS network. Indices mplsTunnelIndex and mplsTunnelInstance uniquely identify a tunnel on the LSR originating the tunnel. To uniquely identify a tunnel across an MPLS network requires

index mplsTunnelIngressLSRId. The last index mplsTunnelEgressLSRId is useful in identifying all instances of a tunnel that terminate on the same egress LSR."

STATUS          current
DESCRIPTION
    "This bit mask indicates optional session values for
    this tunnel. The following describes these bit
    fields:

    fastRerouteThis flag indicates that the any tunnel
    hop may choose to reroute this tunnel without
    tearing it down. This flag permits transit routers
    to use a local repair mechanism which may result in
    violation of the explicit routing of this tunnel.
    When a fault is detected on an adjacent downstream
    link or node, a transit router can re-route traffic
    for fast service restoration.

    mergingPermitted This flag permits transit routers
    to merge this session with other RSVP sessions for
    the purpose of reducing resource overhead on
    downstream transit routers, thereby providing
    better network scaling.

    isPersistent Indicates whether this tunnel should
    be restored automatically after a failure occurs.

    isPinned This flag indicates whether the loose-
    routed hops of this tunnel are to be pinned.

    recordRouteThis flag indicates whether or not the
    signalling protocol should remember the tunnel path
    after it has been signaled."

mplsTunnelHopListIndexNext OBJECT-TYPE
SYNTAX          MplsPathIndexOrZero
MAX-ACCESS      read-only
STATUS          current
DESCRIPTION
    "This object contains an appropriate value to be used
    for mplsTunnelHopListIndex when creating entries in
    the mplsTunnelHopTable. If the number of
    unassigned entries is exhausted, a retrieval

```

operation will return a value of 0. This object may also return a value of 0 when the LSR is unable to accept conceptual row creation, for example, if the `mplsTunnelHopTable` is implemented as read-only. To obtain the value of `mplsTunnelHopListIndex` for a new entry in the `mplsTunnelHopTable`, the manager issues a management protocol retrieval operation to obtain the current value of `mplsTunnelHopIndex`.

When the SET is performed to create a row in the `mplsTunnelHopTable`, the Command Responder (agent) must determine whether the value is indeed still unused; Two Network Management Applications may attempt to create a row (configuration entry) simultaneously and use the same value. If it is currently unused, the SET succeeds and the Command Responder (agent) changes the value of this object, according to an implementation-specific algorithm. If the value is in use, however, the SET fails. The Network Management Application must then re-read this variable to obtain a new usable value."

```
::= { mplsTeObjects 3 }
```

`mplsTunnelHopTable` OBJECT-TYPE

SYNTAX SEQUENCE OF `MplsTunnelHopEntry`

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"The `mplsTunnelHopTable` is used to indicate the hops, strict or loose, for an instance of an MPLS tunnel defined in `mplsTunnelTable`, when it is established via signalling, for the outgoing direction of the tunnel. Thus at a transit LSR, this table contains the desired path of the tunnel from this LSR onwards. Each row in this table is indexed by `mplsTunnelHopListIndex` which corresponds to a group of hop lists or path options. Each row also has a secondary index `mplsTunnelHopIndex`, which indicates a group of hops (also known as a path option). Finally, the third index, `mplsTunnelHopIndex` indicates the specific hop information for a path option. In case we want to specify a particular interface on the originating LSR of an outgoing tunnel by which we want packets to exit the LSR, we specify this as the first hop for this tunnel in `mplsTunnelHopTable`."

```

STATUS current

DESCRIPTION

"This object contains the next appropriate value to be used for mplsTunnelResourceIndex when creating entries in the mplsTunnelResourceTable. If the number of unassigned entries is exhausted, a retrieval operation will return a value of 0. This object may also return a value of 0 when the LSR is unable to accept conceptual row creation, for example, if the mplsTunnelTable is implemented as read-only. To obtain the mplsTunnelResourceIndex value for a new entry, the manager must first issue a management protocol retrieval operation to obtain the current value of this object.

When the SET is performed to create a row in the mplsTunnelResourceTable, the Command Responder (agent) must determine whether the value is indeed still unused; Two Network Management Applications may attempt to create a row (configuration entry) simultaneously and use the same value. If it is currently unused, the SET succeeds and the Command Responder (agent) changes the value of this object, according to an implementation-specific algorithm. If the value is in use, however, the SET fails. The Network Management Application must then re-read this variable to obtain a new usable value."

 -- Tunnel Actual Route Hop table.

mplsTunnelARHopTable OBJECT-TYPE
 SYNTAX SEQUENCE OF MplsTunnelARHopEntry
 MAX-ACCESS not-accessible
 STATUS current
 DESCRIPTION

"The mplsTunnelARHopTable is used to indicate the hops for an MPLS tunnel defined in mplsTunnelTable, as reported by the MPLS signalling protocol. Thus at a transit LSR, this table (if the table is supported and if the signaling protocol is recording actual route information) contains the actual route of the whole tunnel. If the signaling protocol is not recording the actual route, this table MAY report the information from the mplsTunnelHopTable or the mplsTunnelCHopTable.

Each row in this table is indexed by mplsTunnelARHopListIndex. Each row also has a secondary index mplsTunnelARHopIndex, corresponding to the next hop that this row corresponds to.

Please note that since the information necessary to build entries within this table is not provided by some MPLS signalling protocols, implementation of this table is optional. Furthermore, since the information in this table is actually provided by the MPLS signalling protocol after the path has been set-up, the entries in this table are provided only for observation, and hence, all variables in this table are accessible exclusively as read-only.

Note also that the contents of this table may change while it is being read because of re-routing activities. A network administrator may verify that the actual route read is consistent by reference to the mplsTunnelLastPathChange object."

    STATUS          current
    DESCRIPTION
        "The mplsTunnelCHopTable is used to indicate the
        hops, strict or loose, for an MPLS tunnel defined
        in mplsTunnelTable, as computed by a constraint-
        based routing protocol, based on the
        mplsTunnelHopTable for the outgoing direction of
        the tunnel. Thus at a transit LSR, this table (if
        the table is supported) MAY contain the path
        computed by the CSPF engine on (or on behalf of)
        this LSR. Each row in this table is indexed by
        mplsTunnelCHopListIndex. Each row also has a
        secondary index mplsTunnelCHopIndex, corresponding
        to the next hop that this row corresponds to. In
        case we want to specify a particular interface on
        the originating LSR of an outgoing tunnel by which
        we want packets to exit the LSR, we specify this as
        the first hop for this tunnel in
        mplsTunnelCHopTable.
```

Please note that since the information necessary to build entries within this table may not be supported by some LSRs, implementation of this table is optional. Furthermore, since the information in this table describes the path computed by the CSPF engine the entries in this table are read-only."

12. Security Considerations

It is clear that this MIB module is potentially useful for the monitoring of MPLS TE tunnels. This MIB module can also be used for the configuration of certain objects, and anything that can be configured can be incorrectly configured, with potentially disastrous results.

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

- the mplsTunnelTable, mplsTunnelHopTable, mplsTunnelResourceTable, and mplsTunnelCRLDPResTable collectively contain objects to provision MPLS tunnels, tunnel hops, and tunnel resources. Unauthorized access to objects in these tables, could result in disruption of traffic on the network. This is especially true if a tunnel has been established. The use of stronger mechanisms, such as SNMPv3 security, should be considered where possible. Specifically, SNMPv3 VACM and USM MUST be used with any v3 agent which implements this MIB. Administrators should consider whether read access to these objects should be allowed, since read access may be undesirable under certain circumstances.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly

to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- the mplsTunnelTable, mplsTunnelHopTable, mplsTunnelResourceTable, mplsTunnelARHopTable, mplsTunnelCHopTable, mplsTunnelPerfTable, and mplsTunnelCRLDPResTable collectively show the MPLS-TE tunnel network topology and its performance characteristics. If an Administrator does not want to reveal this information, then these tables should be considered sensitive/vulnerable.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED that SNMPv3 be deployed and cryptographic security enabled. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to only those principals (users) that have legitimate rights to those objects.

13. Acknowledgments

We wish to thank Adrian Farrel, Bert Wijnen, Eric Gray, Joan Cucchiara, Patrick Kerharo, Paul Langille, Marcus Brunner, Mike MacFaden, and Mike Piecuch for their comments on this document.

Comments should be made directly to the MPLS mailing list at mpls@uu.net.

14. IANA Considerations

As described in [MPLSMGMT] and as requested in the MPLS-TC-STD-MIB [RFC3811], MPLS related standards track MIB modules should be rooted under the mplsStdMIB subtree. There are 4 MPLS MIB Modules contained in this document, each of the following "IANA Considerations" subsections requests IANA for a new assignment under the mplsStdMIB subtree. New assignments can only be made via a Standards Action as specified in [RFC2434].

14.1. IANA Considerations for MPLS-TE-STD-MIB

The IANA has assigned { mplsStdMIB 3 } to the MPLS-TE-STD-MIB module specified in this document.

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Intellectual Property

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.
