Management Information Base for the Internet Protocol (IP)

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects used for implementations of the Internet Protocol (IP) in an IP version independent manner. This memo obsoletes RFCs 2011, 2465, and 2466.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [9].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [1], STD 58, RFC 2579 [2] and STD 58, RFC 2580 [3].

2. Revision History

One of the primary purposes of this revision of the IP MIB is to create a single set of objects to describe and manage IP modules in an IP version independent manner. Where RFCs 2465 and 2466 created a set of objects independent from RFC 2011, this document merges those three documents into a single unified set of objects. The `ipSystemStatsTable` and `ipIfStatsTable` tables are examples of updating objects to be independent of IP version. Both of these tables contain counters to reflect IP traffic statistics that originated in much earlier MIBs and both include an IP address type in order to separate the information based on IP version.

Another purpose of this document is to increase the manageability of a node running IPv6 by adding new objects. Some of these tables, such as `ipDefaultRouterTable`, may be useful on both IPv4 and IPv6 nodes while others, such as `ipv6RouterAdvertTable`, are specific to a single protocol.

3. Overview

3.1. Multi-Stack Implementations

This MIB does not provide native support for implementations of multiple stacks sharing the same address type. One option for supporting such designs is to assign each stack within an address type to a separate context. These contexts could then be selected based upon the context name, with the Entity MIB and View-based Access Control Model (VACM) Context Table providing methods for listing the supported contexts.

3.2. Discussion of Tables and Groups

This MIB is composed of a small number of discrete objects and a series of tables meant to form the base for managing IPv4 and IPv6 entities.

While some of the objects are meant to be included in all entities, some of the objects are only conditionally mandatory. The unconditionally mandatory objects are mostly counters for IP and ICMP statistics. The conditionally mandatory objects fall into one of several groups: objects for use in higher bandwidth situations, objects for use with IPv4, objects for use with IPv6, and objects for use on IPv6 routers. In short, it is not expected that every entity will implement all of the objects within this MIB. The reader should consult the conformance and compliance section to determine which objects are appropriate for a given entity.

3.2.1. General Objects

In both IPv4 and IPv6, there are only a small number of "knobs" for controlling the general IP stack. Most controls will be in a more specific setting, such as for controlling a router or TCP engine.

This MIB defines a total of three general knobs, only two of which are used for both IPv4 and IPv6.

Objects are included for both protocols to enable or disable forwarding and to set limits on the lifetime of a packet (ttl or hop count).

The third knob, the timeout period for reassembling fragments, is only defined for IPv4, as IPv6 specifies this value directly.

Each group of objects is required when implementing their respective protocols.

3.2.2. Interface Tables

This MIB includes a pair of tables to convey information about the IPv4 and IPv6 protocols that is interface specific.

Special note should be taken of the administrative status objects. These are defined to allow each protocol to selectively enable or disable interfaces. These objects can be used in conjunction with the ifAdminStatus object to manipulate the interfaces as necessary. With these three objects, an interface may be enabled or disabled completely, as well as connected to the IPv4 stack, the IPv6 stack or both stacks. Setting ifAdminStatus to "down" should not affect the protocol specific status objects.

Each interface table is required when implementing their respective protocols.

3.2.3. IP Statistics Tables

The IP statistics tables (ipSystemStatsTable and ipIfStatsTable) contain objects to count the number of datagrams and octets that a given entity has processed. Unlike the previous attempt, this document uses a single table for multiple address types. Typically the only two types of interest are IPv4 and IPv6; however, the table can support other types if necessary.

The first table, ipSystemStatsTable, conveys system wide information. (That is, the various counters are for all interfaces and not a specific set of interfaces.) Its index is formed from a single

sub-id that represents the address type for which the statistics were counted.

The second table, `ipIfStatsTable`, conveys interface specific information. Its index is formed from two sub-ids. The first represents the address type (IPv4 and IPv6), and the interface within that address type is represented by the second sub-id.

The two tables have a similar set of objects that are intended to count the same things, except for the difference in granularity. The object ID `"ipSystemStatsEntry.2"` is reserved in order to align the object IDs of the counters in the first table with their counterparts in the second table.

Several objects to note are `ipSystemStatsDiscontinuityTime`, `ipIfStatsDiscontinuityTime`, `ipSystemStatsRefreshRate`, and `ipIfStatsRefreshRate`. These objects provide information about the row in the table more than about the system itself.

The discontinuity objects allow a management entity to determine if a discontinuity event that would invalidate the management entity's understanding of the counters has occurred. The system being re-initialized or the interface being cycled are possible examples of a discontinuity event.

The refresh objects allow a management entity to determine a proper polling interval for the rest of the objects.

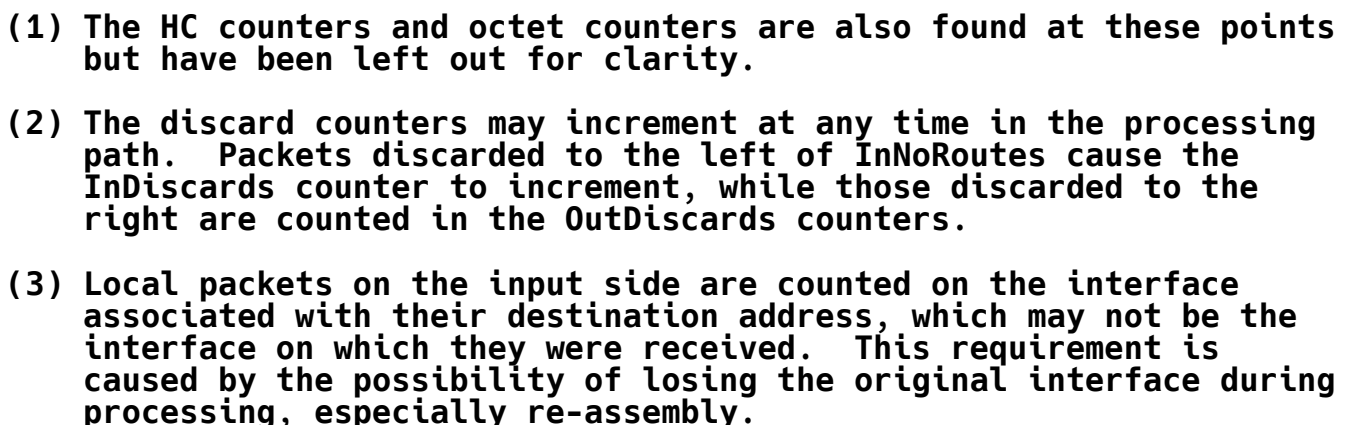

The following Case diagram represents the general ordering of the packet counters. In order to avoid extra clutter, the prefixes `"ipSystemStats"` and `"ipIfStats"` have been removed from each of the counter names.

from
interface

```
V
|
+ InReceives (1)
|
+--> InHdrErrors (5)
|
+->--+ InMcastPkts (1)
|      V
+-<--+
|
+->--+ InBcastPkts (1)
|      V
+-<--+
|
+--> InTruncatedPkts (5)
|
+--> InAddrErrors
|
+--> InDiscards (2)
|
```

from
upper
layers

```
V
|
+ OutRequests
|
+--> OutNoRoutes
|
```

- (4) Some re-assembly algorithms may lose track of the number of fragments during processing and so some fragments may not be counted in this object.
- (5) InTruncatedPkts should only be incremented if the frame contained a valid header but was otherwise shorter than required. Frames that are too short to contain a valid header should be counted as InHdrErrors.
- (6) The forwarding objects may be incremented, even for packets that originated locally or are destined for the local host, if their addresses are such that the local host would need to forward the packet to pass it to the correct interface.
- (7) When fragmenting a packet, an entity should increment the OutFragFails counter, rather than the OutDiscards counter, in order to preserve the equation $\text{Frag0ks} + \text{FragFails} == \text{FragRqds}$.

The objects in both tables are spread amongst several conformance groups based on the bandwidth required to wrap the counters within an hour. The base system group is mandatory for all entities. The other system groups are optional depending on bandwidth. The interface specific-groups are optional.

3.2.4. Internet Address Prefix Table

This table provides information about the prefixes this entity is using, including their lifetimes. This table provides a convenient place to which other tables that make use of prefixes, such as the ipAddressTable, may point. By including this table, the MIB can supply the prefix information for all addresses, yet minimize the amount of duplication required in storing and accessing this data. This arrangement also clarifies the relationship between addresses that have the same prefix.

This table is required for IPv6 entities.

3.2.5. Internet Address Table

This table lists the IP addresses (both IPv4 and IPv6) used by this entity. It also includes some basic information about how and when the address was formed and last updated. This table allows a manager to determine who a given entity thinks it is.

This table is required for all IP entities.

3.2.6. Internet Address Translation Table

This table provides a mapping between IP layer addresses and physical addresses as would be formed by either Address Resolution Protocol (ARP) for IPv4 or the neighbor discovery protocol for IPv6.

3.2.7. IPv6 Scope Zone Index Table

This table specifies the zone index to interface mapping. By examining the table, a manager can determine which groups of interfaces are within a particular zone for a given scope.

The zone index information is only valid within a given entity; the indexes used on one entity may not be comparable to those used on a different entity.

This table is required for IPv6 entities.

3.2.8. Default Router Table

This table lists the default routers known to this entity. This table is intended to be a simple list to display the information that end nodes may have been configured with or acquired through a simple system such as IPv6 router advertisements. Managers attempting to view more complicated routing information should examine the routing specific tables from other MIBs.

This table is required for all entities.

3.2.9. Router Advertisement Table

This table contains the non-routing information that an IPv6 router would use in constructing a router advertisement message. It does not contain information about the prefixes or other routing specific information that the router might advertise. The router should acquire such information from either the routing tables or from some routing table specific MIB.

This table is only required for IPv6 router entities.

3.2.10. ICMP Statistics Tables

There are two sets of statistics for ICMP. The first contains a simple set of counters to track the number of ICMP messages and errors processed by this entity.

The second supplies more detail about the ICMP messages processed by this entity. Its index is formed from two sub-ids. The first represents the address type (IPv4 and IPv6), and the second represents the particular message type being counted. A given row need not be instantiated unless a message of that type has been processed, i.e., the row for icmpMsgStatsType=X MAY be instantiated before but MUST be instantiated after the first message with Type=X is received or transmitted. After receiving or transmitting any succeeding messages with Type=X, the relevant counter must be incremented.

Both of these tables are required for all entities.

3.2.11. Conformance and Compliance

This MIB contains several sets of objects. Some of these sets are useful on all types of entities, while others are only useful on a limited subset of entities. The conformance section attempts to group the objects into sets that may be discussed as units, and the compliance section then details which of these units are required in various circumstances.

The circumstances used in the compliance section are implementing IPv4, IPv6, or IPv6 router functions and having a bandwidth of less than 20MB, between 20MB and 650MB, or greater than 650MB.

3.2.12. Deprecated Objects

This MIB also includes a set of deprecated objects from previous iterations. They are included as part of the historical record.

4. Updating Implementations

There are several general classes of change that are required.

The first and most major change is that most of the previous objects have different object IDs and additional indexes to support the possibility of different address types. The general counters for IP and ICMP are examples of this. They have been moved to the ipSystemStatsTable and icmpMsgStatsTable, respectively.

The second change is the extension of all address objects to allow for both IPv4 and IPv6 addresses and the addition of an address type object to specify what address type is in use.

The third change is the addition of several new objects to the replacement for a previously existing table such as ipNetToPhysical.

The fourth change is the addition of completely new tables such as `ipIfStatsTable` and `ipDefaultRouterTable`. The first is based on the previous statistics groups, while the second is completely new to this MIB.

4.1. Updating an Implementation of the IPv4-only IP-MIB

The somewhat more specific changes that are required for IPv4 follow. Note well: this is not meant to be an exhaustive list and the reader should examine the MIB for full details.

Several of the general objects (`ipForwarding`, `ipDefaultTTL`, `ipReasmTimeout`) remain unchanged.

Most of the rest of the general objects were counters and have been moved into the `ipSystemStatsTable`. The basic instrumentation should remain the same, though the object definitions should be checked for clarifications. If they aren't already in a structure, putting the counter variables in one would be useful. Several new objects have been added to count additional items, and instrumentation code must be added for these objects. Finally, the SNMP routines must be updated to handle the new indexing.

In addition to the `ipSystemStatsTable`, the MIB includes the `ipIfStatsTable`. This table counts the same items as the system table but does so on a per interface basis. It is optional and may be ignored. If you decide to implement it, you may wish to arrange to collect the data on a per-interface basis and then sum those counters in order to provide the aggregate system level statistics. However, if you choose to provide the system level statistics by summing the interface level counters, no interface level statistics can be lost - if an interface is removed, the statistics associated with it must be retained.

The `ipAddrTable` has, loosely, been converted to the `ipAddressTable`. While the general idea remains the same, the `ipAddressTable` is sufficiently different that writing new code may be easier than updating old code. The primary difference is the addition of several new objects. In addition, the `ipAdEntReasmMaxSize` has been moved to another table, `ipv4InterfaceTable`. As above, the SNMP routines will need to be updated to handle the new indexing.

The `ipNetToMediaTable` has been moved to the `ipNetToPhysicalTable`. These tables are fairly similar and updating the old code may be straightforward. As above, the SNMP routines will need to be updated to handle the new indexing.

Two new tables, `ipv4InterfaceTable` and `ipDefaultRouterTable`, are required as well as several new ICMP counters.

Finally, there are several tables that are required for IPv6 but are optional for IPv4 that you may elect to implement.

4.2. Updating an Implementation of the IPv6-MIB

The somewhat more specific changes that are required for IPv6 follow. Note well: this is not meant to be an exhaustive list and the reader should examine the MIB for full details.

Two of the general objects, `ipv6Forwarding` and `ipv6DefaultHopLimit`, have been renamed and given new object identifiers within the `ip` branch but are otherwise unchanged. The new names are `ipv6IpForwarding` and `ipv6IpDefaultHopLimit`.

While there is an `ipv6InterfaceTable` that contains some of the pieces from the `ipv6IfTable`, the two are somewhat different in concept. The `ipv6IfTable` was meant to replicate the `ifTable` while the `ipv6InterfaceTable` is meant to be an addition to the `ifTable`. As such, items that were duplicated between the `ifTable` and `ipv6IfTable` have been removed and some new objects added.

The `ipv6IfStatsTable` most closely resembles the `ipIfStatsTable` with an additional index for the address type and most of the instrumentation should be re-usable. Some new objects have been added to the `ipIfStatsTable`. As above, the SNMP routines will need to be updated to handle the new indexing. Finally, the `ipIfStatsTable` is optional and may be ignored.

The `ipSystemStatsTable` is effectively new, but it may be able to make use of most of the instrumentation from the old `ipv6IfStatsTable`. As with the IPv4 discussion, one implementation strategy would be to count the statistics for the `ipIfStatsTable` and aggregate them when queried for this table. Again, as with the IPv4 discussion, this strategy only works if the interfaces cannot be removed or if the statistics for removed interfaces are somehow retained.

The `ipv6AddrPrefixTable` is now the `ipAddressPrefixTable`. The new table contains an extra object and the additional index required for IPv4 compatibility. As above, the SNMP routines will need to be updated to handle the new indexing.

The `ipAddressTable` is loosely based on the `ipv6AddrTable` but has changed considerably with the addition of several new objects and the removal of one of its indexes.

The IPv6 routing information (ipv6RouteNumber, ipv6DiscardedRoutes, and ipv6RouteTable) has been removed from this MIB. The replacements or updates for this information is in the update to the IP Forwarding Table MIB [16]. The ipv6NetToMediaTable has been converted to the ipNetToPhysicalTable. The new table contains an extra object and the additional index required for IPv4 compatibility. As above, the SNMP routines will need to be updated to handle the new indexing.

The ICMP tables have been substantially changed. The previous tables required counting on a per-message and per-interface basis. The new tables only require counting on a per-message, per-protocol basis and include an aggregate of all messages on a per-protocol basis.

In addition to the above, several new tables have been added. Both the ipv6ScopeZoneIndexTable and ipDefaultRouterTable are required on all IPv6 entities. The ipv6RouterAdvertTable is only required on IPv6 routers.

5. Definitions

The following MIB module imports from the IF-MIB [6] and the INET-ADDRESS-MIB [7] and references Neighbor Discovery [4], the IPv6 Stateless Address Autoconfiguration protocol [5], the Default Router Preferences document [8], ARP [10] and the IPv6 address architecture document [17].

DESCRIPTION

"The MIB module for managing IP and ICMP implementations, but excluding their management of IP routes.

Copyright (C) The Internet Society (2006). This version of this MIB module is part of RFC 4293; see the RFC itself for full legal notices."

REVISION "200602020000Z"

DESCRIPTION

"The IP version neutral revision with added IPv6 objects for ND, default routers, and router advertisements. As well as being the successor to RFC 2011, this MIB is also the successor to RFCs 2465 and 2466. Published as RFC 4293."

REVISION "199411010000Z"

DESCRIPTION

"A separate MIB module (IP-MIB) for IP and ICMP management objects. Published as RFC 2011."

REVISION "199103310000Z"

DESCRIPTION

"The initial revision of this MIB module was part of MIB-II, which was published as RFC 1213."

::= { mib-2 48}

--

-- The textual conventions we define and use in this MIB.

--

IpAddressOriginTC ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"The origin of the address.

manual(2) indicates that the address was manually configured to a specified address, e.g., by user configuration.

dhcp(4) indicates an address that was assigned to this system by a DHCP server.

linklayer(5) indicates an address created by IPv6 stateless

auto-configuration.

random(6) indicates an address chosen by the system at random, e.g., an IPv4 address within 169.254/16, or an RFC 3041 privacy address."

```
SYNTAX      INTEGER {  
    other(1),  
    manual(2),  
    dhcp(4),  
    linklayer(5),  
    random(6)  
}
```

IpAddressStatusTC ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"The status of an address. Most of the states correspond to states from the IPv6 Stateless Address Autoconfiguration protocol.

The preferred(1) state indicates that this is a valid address that can appear as the destination or source address of a packet.

The deprecated(2) state indicates that this is a valid but deprecated address that should no longer be used as a source address in new communications, but packets addressed to such an address are processed as expected.

The invalid(3) state indicates that this isn't a valid address and it shouldn't appear as the destination or source address of a packet.

The inaccessible(4) state indicates that the address is not accessible because the interface to which this address is assigned is not operational.

The unknown(5) state indicates that the status cannot be determined for some reason.

The tentative(6) state indicates that the uniqueness of the address on the link is being verified. Addresses in this state should not be used for general communication and should only be used to determine the uniqueness of the address.

The duplicate(7) state indicates the address has been determined to be non-unique on the link and so must not be

used.

The optimistic(8) state indicates the address is available for use, subject to restrictions, while its uniqueness on a link is being verified.

In the absence of other information, an IPv4 address is always preferred(1)."

REFERENCE "RFC 2462"

SYNTAX      INTEGER {
                    forwarding(1),    -- acting as a router
                    notForwarding(2) -- NOT acting as a router
                }
```

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"The indication of whether this entity is acting as an IPv6 router on this interface with respect to the forwarding of datagrams received by, but not addressed to, this entity. IPv6 routers forward datagrams. IPv6 hosts do not (except those source-routed via the host).

This object is constrained by ipv6IpForwarding and is ignored if ipv6IpForwarding is set to notForwarding. Those systems that do not provide per-interface control of the forwarding function should set this object to forwarding for all interfaces and allow the ipv6IpForwarding object to control the forwarding capability.

When this object is written, the entity SHOULD save the change to non-volatile storage and restore the object from non-volatile storage upon re-initialization of the system."

::= { ipv6InterfaceEntry 8 }

```
--
-- Per-Interface or System-Wide IP statistics.
--
-- The following two tables, ipSystemStatsTable and ipIfStatsTable,
-- are intended to provide the same counters at different granularities.
-- The ipSystemStatsTable provides system wide counters aggregating
-- the traffic counters for all interfaces for a given address type.
-- The ipIfStatsTable provides the same counters but for specific
-- interfaces rather than as an aggregate.
--
-- Note well: If a system provides both system-wide and interface-
-- specific values, the system-wide value may not be equal to the sum
-- of the interface-specific values across all interfaces due to e.g.,
-- dynamic interface creation/deletion.
--
-- Note well: Both of these tables contain some items that are
```

-- represented by two objects, representing the value in either 32
 -- or 64 bits. For those objects, the 32-bit value MUST be the low
 -- order 32 bits of the 64-bit value. Also note that the 32-bit
 -- counters must be included when the 64-bit counters are included.

--

ipAddressPrefixTable OBJECT-TYPE

SYNTAX SEQUENCE OF IpAddressPrefixEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"This table allows the user to determine the source of an IP address or set of IP addresses, and allows other tables to share the information via pointer rather than by copying.

For example, when the node configures both a unicast and anycast address for a prefix, the ipAddressPrefix objects for those addresses will point to a single row in this table.

This table primarily provides support for IPv6 prefixes, and several of the objects are less meaningful for IPv4. The table continues to allow IPv4 addresses to allow future flexibility. In order to promote a common configuration, this document includes suggestions for default values for IPv4 prefixes. Each of these values may be overridden if an object is meaningful to the node.

All prefixes used by this entity should be included in this table independent of how the entity learned the prefix.
(This table isn't limited to prefixes learned from router

```

        advertisements.)"

ipAddressSpinLock OBJECT-TYPE

SYNTAX TestAndIncr

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"An advisory lock used to allow cooperating SNMP managers to coordinate their use of the set operation in creating or modifying rows within this table.

In order to use this lock to coordinate the use of set operations, managers should first retrieve ipAddressTableSpinLock. They should then determine the appropriate row to create or modify. Finally, they should issue the appropriate set command, including the retrieved value of ipAddressSpinLock. If another manager has altered the table in the meantime, then the value of ipAddressSpinLock will have changed, and the creation will fail as it will be specifying an incorrect value for ipAddressSpinLock. It is suggested, but not required, that the ipAddressSpinLock be the first var bind for each set of objects representing a 'row' in a PDU."

::= { ip 33 }

ipAddressTable OBJECT-TYPE

SYNTAX SEQUENCE OF IpAddressEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"This table contains addressing information relevant to the entity's interfaces.

This table does not contain multicast address information. Tables for such information should be contained in multicast specific MIBs, such as RFC 3019.

While this table is writable, the user will note that several objects, such as ipAddressOrigin, are not. The intention in allowing a user to write to this table is to allow them to add or remove any entry that isn't

permanent. The user should be allowed to modify objects and entries when that would not cause inconsistencies within the table. Allowing write access to objects, such as `ipAddressOrigin`, could allow a user to insert an entry and then label it incorrectly.

Note well: When including IPv6 link-local addresses in this table, the entry must use an `InetAddressType` of 'ipv6z' in order to differentiate between the possible interfaces."

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"The type of mapping.

Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipNetToPhysicalTable. That is, it effectively dis-associates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent

removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant `ipNetToPhysicalType` object.

The `'dynamic(3)'` type indicates that the IP address to physical addresses mapping has been dynamically resolved using e.g., IPv4 ARP or the IPv6 Neighbor Discovery protocol.

The `'static(4)'` type indicates that the mapping has been statically configured. Both of these refer to entries that provide mappings for other entities addresses.

The `'local(5)'` type indicates that the mapping is provided for an entity's own interface address.

As the entries in this table are typically not persistent when this object is written the entity **SHOULD NOT** save the change to non-volatile storage."

DESCRIPTION

"An indication of preference given to this router as a default router as described in the Default Router Preferences document. Treating the value as a 2 bit signed integer allows for simple arithmetic comparisons.

For IPv4 routers or IPv6 routers that are not using the updated router advertisement format, this object is set to medium (0)."

REFERENCE "RFC 4291, section 2.1"

--
```

ipv6RouterAdvertSpinLock OBJECT-TYPE

SYNTAX TestAndIncr

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"An advisory lock used to allow cooperating SNMP managers to coordinate their use of the set operation in creating or modifying rows within this table.

In order to use this lock to coordinate the use of set operations, managers should first retrieve ipv6RouterAdvertSpinLock. They should then determine the appropriate row to create or modify. Finally, they should issue the appropriate set command including the retrieved value of ipv6RouterAdvertSpinLock. If another manager has altered the table in the meantime, then the value of ipv6RouterAdvertSpinLock will have changed and the creation will fail as it will be specifying an incorrect value for ipv6RouterAdvertSpinLock. It is suggested, but not required, that the ipv6RouterAdvertSpinLock be the first var bind for each set of objects representing a 'row' in a PDU."

ipInReceives OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The total number of input datagrams received from interfaces, including those received in error."

This object has been deprecated, as a new IP version-neutral

table has been added. It is loosely replaced by
ipSystemStatsInReceives."
 ::= { ip 3 }

ipInHdrErrors OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of input datagrams discarded due to errors in their IPv4 headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IPv4 options, etc.

This object has been deprecated as a new IP version-neutral table has been added. It is loosely replaced by
ipSystemStatsInHdrErrors."

::= { ip 4 }

ipInAddrErrors OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of input datagrams discarded because the IPv4 address in their IPv4 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IPv4 routers, and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by
ipSystemStatsInAddrErrors."

::= { ip 5 }

ipForwDatagrams OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of input datagrams for which this entity was not their final IPv4 destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IPv4 routers, this counter will include only those packets which

were Source-Routed via this entity, and the Source-Route option processing was successful.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by `ipSystemStatsInForwDatagrams`."

::= { ip 6 }

ipInUnknownProtos OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

ipNetToMediaType OBJECT-TYPE

SYNTAX INTEGER {

other(1),

invalid(2),

dynamic(3),

static(4)

}

-- none of the following

-- an invalidated mapping

MAX-ACCESS read-create

STATUS deprecated

DESCRIPTION

"The type of mapping.

Setting this object to the value invalid(2) has the effect

of invalidating the corresponding entry in the ipNetToMediaTable. That is, it effectively dis-associates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipNetToMediaType object.

As the entries in this table are typically not persistent when this object is written the entity should not save the change to non-volatile storage. Note: a stronger requirement is not used because this object was previously defined."

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Address Mask Request messages received.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 12 }

icmpInAddrMaskReps OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Address Mask Reply messages received.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 13 }

icmpOutMsgs OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The total number of ICMP messages which this entity attempted to send. Note that this counter includes all those counted by icmpOutErrors.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by icmpStatsOutMsgs."

::= { icmp 14 }

icmpOutErrors OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP messages which this entity did not send due to problems discovered within ICMP, such as a lack of buffers. This value should not include errors discovered outside the ICMP layer, such as the inability of IP to route the resultant datagram. In some implementations, there may be no types of error which contribute to this counter's value.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by icmpStatsOutErrors."

::= { icmp 15 }

icmpOutDestUnreachs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Destination Unreachable messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 16 }

icmpOutTimeExcds OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Time Exceeded messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 17 }

icmpOutParmProbs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Parameter Problem messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 18 }

icmpOutSrcQuenchs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Source Quench messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 19 }

icmpOutRedirects OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 20 }

icmpOutEchos OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of ICMP Echo (request) messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 21 }

icmpOutEchoReps OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Echo Reply messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 22 }

icmpOutTimestamps OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Timestamp (request) messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 23 }

icmpOutTimestampReps OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Timestamp Reply messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 24 }

icmpOutAddrMasks OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION

"The number of ICMP Address Mask Request messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 25 }

icmpOutAddrMaskReps OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only
 STATUS deprecated
 DESCRIPTION

"The number of ICMP Address Mask Reply messages sent.

This object has been deprecated, as a new IP version-neutral table has been added. It is loosely replaced by a column in the icmpMsgStatsTable."

::= { icmp 26 }

-- deprecated conformance information
 -- deprecated compliance statements

ipMIBCompliance MODULE-COMPLIANCE

STATUS deprecated
 DESCRIPTION

"The compliance statement for systems that implement only IPv4. For version-independence, this compliance statement is deprecated in favor of ipMIBCompliance2."

MODULE -- this module

MANDATORY-GROUPS { ipGroup,
 icmpGroup }

::= { ipMIBCompliances 1 }

-- deprecated units of conformance

ipGroup OBJECT-GROUP

8. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

ipForwarding and **ipv6IpForwarding** - these objects allow a manager to enable or disable the routing functions on the entity. By disabling the routing functions, an attacker would possibly be able to deny service to users. By enabling the routing functions, an attacker could open a conduit into an area. This might result in the area providing transit for packets it shouldn't or might allow the attacker access to the area bypassing security safeguards.

ipDefaultTTL and **ipv6IpDefaultHopLimit** - these objects allow a manager to determine the diameter of the valid area for a packet. By decreasing the value of these objects, an attacker could cause packets to be discarded before reaching their destinations.

ipv4InterfaceEnableStatus and **ipv6InterfaceEnableStatus** - these objects allow a manager to enable or disable IPv4 and IPv6 on a specific interface. By enabling a protocol on an interface, an attacker might be able to create an unsecured path into a node (or through it if routing is also enabled). By disabling a protocol on an interface, an attacker might be able to force packets to be routed through some other interface or deny access to some or all of the network via that protocol.

ipAddressTable - the objects in this table specify the addresses in use on this node. By modifying this information, an attacker can cause a node to either ignore messages destined to it or accept (at least at the IP layer) messages it would otherwise ignore. The use of filtering or security associations may reduce the potential damage in the latter case.

ipv6RouterAdvertTable - the objects in this table specify the information that a router should propagate in its routing advertisement messages. By modifying this information, an attacker can interfere with the auto-configuration of all hosts on the link. Most modifications to this table will result in a

denial of service to some or all hosts on the link. However two objects, `ipv6RouterAdvertManagedFlag` and `ipv6RouterAdvertOtherConfigFlag`, indicate if a host should acquire configuration information from some other source. By enabling these, an attacker might be able to cause a host to retrieve its configuration information from a compromised source.

`ipNetToPhysicalPhysAddress` and `ipNetToPhysicalType` - these objects specify information used to translate a network (IP) address into a media dependent address. By modifying these objects, an attacker could disable communication with a node or divert messages from one node to another. However, the attacker may be able to carry out a similar attack by simply responding to the ARP or ND request made by the target node.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP.

These are the tables and objects and their sensitivity/vulnerability:

Essentially, all of the objects in this MIB could be considered sensitive as they report on the status of the IP modules within a system. However, the `ipSystemStatsTable`, `ipIfStatsTable`, and `ipAddressTable` are likely to be of most interest to an attacker. The statistics tables supply information about the quantity and type of traffic this node is processing and, especially for transit providers, may be considered sensitive. The address table provides a convenient list of all addresses in use by this node. Each address in isolation is unremarkable, however, the total list would allow an attacker to correlate otherwise unrelated traffic. For example, an attacker might be able to correlate an RFC 3041 [15] private address with known public addresses, thus circumventing the intentions of RFC 3041.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [9], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
