ASSIGNED NUMBERS

Status of this Memo

This memo is a status report on the parameters (i.e., numbers and keywords) used in protocols in the Internet community. Distribution of this memo is unlimited.

OVERVIEW

This RFC is a snapshot of the ongoing process of the assignment of protocol parameters for the Internet protocol suite. To make the current information readily available the assignments are kept up-to-date in a set of online text files. This RFC has been assembled by catinating these files together with a minimum of formatting "glue". The authors appologize for the somewhat rougher formatting and style than is typical of most RFCs.

We expect that various readers will notice specific items that should be corrected. Please send any specific corrections via email to <iana@isi.edu>.

J. Reynolds

October 1994

J. Postel

ISI

INTRODUCTION

The files in this directory document the currently assigned values for several series of numbers used in network protocol implementations.

ftp://ftp.isi.edu/in-notes/iana/assignments

The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols. The IANA is chartered by the Internet Society (ISOC) and the Federal Network Council (FNC) to act as the clearinghouse to assign and coordinate the use of numerous Internet protocol parameters.

The Internet protocol suite, as defined by the Internet Engineering Task Force (IETF) and its steering group (the IESG), contains numerous parameters, such as internet addresses, domain names, autonomous system numbers (used in some routing protocols), protocol numbers, port numbers, management information base object identifiers, including private enterprise numbers, and many others.

The common use of the Internet protocols by the Internet community requires that the particular values used in these parameter fields be assigned uniquely. It is the task of the IANA to make those unique assignments as requested and to maintain a registry of the currently assigned values.

Requests for parameter assignments (protocols, ports, etc.) should be sent to <iana@isi.edu>.

Requests for SNMP network management private enterprise number assignments should be sent to <iana-mib@isi.edu>.

The IANA is located at and operated by the Information Sciences Institute (ISI) of the University of Southern California (USC).

If you are developing a protocol or application that will require the use of a link, socket, port, protocol, etc., please contact the IANA to receive a number assignment.

Joyce K. Reynolds Internet Assigned Numbers Authority USC - Information Sciences Institute 4676 Admiralty Way Marina del Rey, California 90292-6695

Electronic mail: IANA@ISI.EDU

Phone: +1 310-822-1511

Most of the protocols are documented in the RFC series of notes. Some of the items listed are undocumented. Further information on protocols can be found in the memo, "Internet Official Protocol Standards" (STD 1).

Data Notations

The convention in the documentation of Internet Protocols is to express numbers in decimal and to picture data in "big-endian" order [COHEN]. That is, fields are described left to right, with the most significant octet on the left and the least significant octet on the right.

The order of transmission of the header and data described in this document is resolved to the octet level. Whenever a diagram shows a group of octets, the order of transmission of those octets is the normal order in which they are read in English. For example, in the following diagram the octets are transmitted in the order they are numbered.

															6													1	
Ĭ	 -+	4	,	•	Ĺ	•	•	İ		2	<u>2</u>	•	•	•	 	•		3				İ	•	•	٠	4		 	
į		- ' 4		į	5					6	5				 		-	7							8	3		 <u> </u>	
į	-+	·-+			9 +	+	+	 +	 ⊦	1() 	+			 +	+	 1: 	L ⊦	' ⊦	' ⊦=⊣	- 	 ⊦			12	<u>2</u> +	⊦-⊣	 +	

Transmission Order of Bytes

Whenever an octet represents a numeric quantity the left most bit in the diagram is the high order or most significant bit. That is, the bit labeled 0 is the most significant bit. For example, the following diagram represents the value 170 (decimal).

0	1	2	3	4	5	6	7	
+-+	-	 -	 -	 -	-	-	 -	+
1	0	1	0	1	0	1	0	ı
+								•

Significance of Bits

Similarly, whenever a multi-octet field represents a numeric quantity the left most bit of the whole field is the most significant bit. When

Reynolds & Postel

[Page 3]

a multi-octet quantity is transmitted the most significant octet is transmitted first.

Special Addresses

There are five classes of IP addresses: Class A through Class E. Of these, Classes A, B, and C are used for unicast addresses, Class D is used for multicast addresses, and Class E addresses are reserved for future use.

With the advent of classless addressing [CIDR1, CIDR2], the network-number part of an address may be of any length, and the whole notion of address classes becomes less important.

There are certain special cases for IP addresses. These special cases can be concisely summarized using the earlier notation for an IP address:

if we also use the notation "-1" to mean the field contains all 1 bits. Some common special cases are as follows:

 $(a) \{0, 0\}$

This host on this network. Can only be used as a source address (see note later).

(b) {0, <Host-number>}

Specified host on this network. Can only be used as a source address.

 $\{c\}$ $\{-1, -1\}$

Limited broadcast. Can only be used as a destination address, and a datagram with this address must never be forwarded outside the (sub-)net of the source.

(d) {<Network-number>, -1}

Directed broadcast to specified network. Can only be used as a destination address.

(e) {<Network-number>, <Subnet-number>, -1}

Directed broadcast to specified subnet. Can only be used as a destination address.

(f) {<Network-number>, -1, -1}

Directed broadcast to all subnets of specified subnetted network. Can only be used as a destination address.

(g) {127, <any>}

Internal host loopback address. Should never appear outside a host.

VERSION NUMBERS

In the Internet Protocol (IP) [RFC791] there is a field to identify the version of the internetwork general protocol. This field is 4 bits in size.

Assigned Internet Version Numbers

Decimal	Keyword	Version	References
0		Reserved	[JBP]
1-3		Unassigned	ЃЈВР
4	ΙP	Internet Protocol	[RFC791,JBP] [RFC1190,JWF]
5	ST	ST Datagram Mode	[RFC1190,JWF]
6	SIP	Simple Internet Protocol	
7	TP/IX	TP/IX: The Next Internet	[RXU]
8	PIP	The P Internet Protocol	[PXF]
9	TUBA	TUBA	[RXC]
10-14		Unassigned	[JBP]
15		Reserved	[JBP]

WELL KNOWN PORT NUMBERS

The Well Known Ports are controlled and assigned by the IANA and on most systems can only be used by system (or root) processes or by programs executed by privileged users.

Ports are used in the TCP [RFC793] to name the ends of logical connections which carry long term conversations. For the purpose of providing services to unknown callers, a service contact port is defined. This list specifies the port used by the server process as its contact port. The contact port is sometimes called the "well-known port".

To the extent possible, these same port assignments are used with the UDP [RFC768].

The assigned ports use a small portion of the possible port numbers. For many years the assigned ports were in the range 0-255. Recently, the range for assigned ports managed by the IANA has been expanded to the range 0-1023.

Port Assignments:

#		IANA <iana@isi.edu></iana@isi.edu>

REGISTERED PORT NUMBERS

The Registered Ports are not controlled by the IANA and on most systems can be used by ordinary user processes or programs executed by ordinary users.

Ports are used in the TCP [RFC793] to name the ends of logical connections which carry long term conversations. For the purpose of providing services to unknown callers, a service contact port is defined. This list specifies the port used by the server process as its contact port. While the IANA can not control uses of these ports it does register or list uses of these ports as a convienence to the community.

To the extent possible, these same port assignments are used with the UDP [RFC768].

The Registered Ports are in the range 1024-65535.

Port Assignments:

SUN RPC NUMBERS

To obtain SUN Remote Procedure Call (RPC) numbers send an e-mail request to "rpc@sun.com".

The RPC port management service ('portmap' in SunOS versions less than 5.0 and 'rpcbind' in SunOS versions greater than 5.0) "registers" the IP port number that is allocated to a particular service when that service is created. It does not allocate ports on behalf of those services.

For an exact specification of the semantics refer to the source code of svcudp_create() and svctcp_create() in the archives. In short however is that these interfaces, and svc_tli_create their Transport Independent RPC equivalent, take either a user specified port number or RPC_ANY (-1) which effectively means "I don't care." In the "I don't care" case the create code simply calls socket(2) or t_open(3n) which allocates an IP port based on the rules:

if euid of the requesting process is 0 (i.e., root) allocate the next available port number in the reserved port range.

else

allocate the next available port in the non-reserved range.

Port numbers count up sequentially.

Can a port that is "assigned" can be used when the assignee's service is not present? Say port 501 is assigned to the "jeans" service. On a machine that does not have the "jeans" service, nor has any clients that might be expecting to use it, is port 501 available for other uses? Any dynamic allocation process, like the portmapper, that chooses the next unused port might allocate port 501 dynamically to a process that asked for a "I don't care" port. So any dynamic allocation scheme may pick an unused port that happened to correspond to a port number that had been "assigned" but was currently unused.

While it might be desirable, it is impossible to guarantee that any unused port, even though officially assigned to a service, is not picked by a dynamic allocator since such an assignment might occur long after the delivery of the system into a site that doesn't watch for the latest list.

There is the restriction that only "superuser" on BSD derived systems such as SunOS can bind to a port number that is less than 1024. So programs have used this information in the past to identify whether or

not the service they were talking to was started by the superuser on the remote system. Making this assumption is dangerous because not all system enforce this restriction.

Sun RPC services use ports that are currently unused. If someone noted that an RPC service was using port 781, it would be just as happy using port 891, or 951. The service doesn't care what port it gets, remote clients will query the portmapper to ask it what port number was assigned to the service when it was started. The key is that the port was not currently in use. The only port that ONC/RPC must have is 111 its assigned port for the portmap service.

The most common complaint comes when people put a new service on their system. When they configure their systems they put the new service configuration commands at the end of their system startup scripts. During startup, several network services may be started. Those services that are ONC/RPC based just pick the next available port, those that have pre-assigned ports bind to their pre-assigned port. Clearly the correct sequence is to have all services that need a particular port to be started first (or if they are "latent" services that are started by inetd, to have inetd started). Finally, the RPC services should be started as they will be assigned unused ports. (In the BSD networking code (which we use) the algorithm for picking ports is in the file in_pcb.c, function in_pcbbind().)

Services should be started in this order:

- a) Services that will "run" continuously and have an assigned port. Note that this includes rpcbind (nee portmap) that has port 111 assigned to it.
- b) inetd which will automatically create sockets for those services that have reserved ports but only run on demand (like finger)
- c) RPC services which will automatically pick unused ports and maximize efficiency of the "IP Port" namespace.

The include file /usr/include/netinet/in.h defines a constant IPPORT RESERVED to be 1024. The relevant text is:

```
/*
 * Ports < IPPORT_RESERVED are reserved for
 * privileged processes (e.g. root).
 * Ports > IPPORT_USERRESERVED are reserved
 * for servers, not necessarily privileged.
 */
#define IPPORT_RESERVED 1024
```

#define IPPORT_USERRESERVED 5000

Portmap does not allocate ports, the kernel allocates ports. The code that does this is part of nearly every UNIX system in the world (and since the BSD code is 'free' it is often the same code). RPC services ask the kernel to allocate them a port by calling the "bind()" system call. The parameter they pass is "INADDR_ANY" which means "allocate me any IP port you want". The kernel does that by looking at all of the ports that are currently in use and picking one that is not currently used. The number picked is either less that 1024 if the process is privledged, or greater than 1024 if the process is not privledged. After the kernel has allocated a port, the service registers this allocation with portmap. The portmapper is merely a registry of previously allocated ports. Note "allocated" here is being used in the sense that they are used by an open socket, not assigned a well known name.

The role of /etc/services is to provide an idea to people who are looking at network traffic as to where a packet may have originated from or is headed to. For services like finger that have assigned ports, they can just hard code the port they want into their executable. (it isn't like it will change, and if they read it from /etc/services and someone had mistyped the port number it won't interoperate with clients anyway!)

It is not practical to read the /etc/services file into the kernel to prevent it from giving out port numbers that are "pre-assigned", nor is it generally desirable since with the correct ordering of startup it is completely unneccesary.

Editors Note: This information was supplied by Chuck McManis of Sun.

IP OPTION NUMBERS

The Internet Protocol (IP) has provision for optional header fields identified by an option type field. Options 0 and 1 are exactly one octet which is their type field. All other options have their one octet type field, followed by a one octet length field, followed by length-2 octets of option data. The option type field is sub-divided into a one bit copied flag, a two bit class field, and a five bit option number. These taken together form an eight bit value for the option type field. IP options are commonly referred to by this value.

Сору	Class	Number	Value	Name			Reference
0	0	0	0	EOOL		End of Options List	[RFC791,JBP]

IP TIME TO LIVE PARAMETER

The current recommended default time to live (TTL) for the Internet Protocol (IP) [45,105] is 64.

IP TOS PARAMETERS

This documents the default Type-of-Service values that are currently recommended for the most important Internet protocols.

TOS Value	Description	Reference
0000	Default	[RFC1349]
0001	Minimize Monetary Cost	[RFC1349]
0010	Maximize Reliability	[RFC1349]
0100	Maximize Throughput	[RFC1349]
1000	Minimize Delay '	[RFC1349]
1111	Maximize Security	[RFC1455]

The TOS value is used to indicate "better". Only one TOS value or property can be requested in any one IP datagram.

Generally, protocols which are involved in direct interaction with a human should select low delay, while data transfers which may involve large blocks of data are need high throughput. Finally, high reliability is most important for datagram-based Internet management functions.

Application protocols not included in these tables should be able to make appropriate choice of low delay (8 decimal, 1000 binary) or high throughput (4 decimal, 0100 binary).

The following are recommended values for TOS:

Protocol	TOS Value	
TELNET (1)	1000	(minimize delay)
FTP Control Data (2)	1000 0100	(minimize delay) (maximize throughput)
TFTP	1000	(minimize delay)
SMTP (3) Command phase DATA phase	1000 0100	(minimize delay) (maximize throughput)
Domain Name Servic UDP Query TCP Query Zone Transfer	e 1000 0000 0100	<pre>(minimize delay) (maximize throughput)</pre>
NNTP	0001	<pre>(minimize monetary cost)</pre>
ICMP		

Errors 0000 Requests 0000 (4)

Responses <same as request> (4)

Any IGP 0010 (maximize reliability)

EGP 0000

SNMP 0010 (maximize reliability)

B00TP 0000

Notes:

(1) Includes all interactive user protocols (e.g., rlogin).

- (2) Includes all bulk data transfer protocols (e.g., rcp).
- (3) If the implementation does not support changing the TOS during the lifetime of the connection, then the recommended TOS on opening the connection is the default TOS (0000).
- (4) Although ICMP request messages are normally sent with the default TOS, there are sometimes good reasons why they would be sent with some other TOS value. An ICMP response always uses the same TOS value as was used in the corresponding ICMP request message.

An application may (at the request of the user) substitute 0001 (minimize monetary cost) for any of the above values.

TCP OPTION NUMBERS

The Transmission Control Protocol (TCP) has provision for optional header fields identified by an option kind field. Options 0 and 1 are exactly one octet which is their kind field. All other options have their one octet kind field, followed by a one octet length field, followed by length-2 octets of option data.

Kind	Length	Meaning	Reference
0		End of Option List	[RFC793]
1	_	No-Operation	TRFC7931
	4	Maximum Segment Lifetime	[RFC793]
2 3 4 5 6 7 8 9	3	WSOPT - Window Scale	[RFC1323]
4	3 2	SACK Permitted	[RFC1072]
5	N 6 6	SACK	[RFC1072]
6	6	Echo (obsoleted by option 8)	[RFC1072]
7		Echo Reply (obsoleted by option 8)	[RFC1072]
8	10	TSOPT - Time Stamp Option	[RFC1323]
	2 5	Partial Order Connection Permitted	I[RFC1693]
10	5	Partial Order Service Profile	[RFC1693]
11		CC	[Braden]
12		CC.NEW	[Braden]
13		CC.ECHO	[Braden]
14	3	TCP Alternate Checksum Request	[RFC1146]
1 5	N	TCP Alternate Checksum Data	[RFC1146]
16		Skeeter	[Knowles]
17		Bubba	[Knowles]
18	3	Trailer Checksum Option [Subbu	& Monroe]

TCP ALTERNATE CHECKSUM NUMBERS

Number	Description	Reference
0	TCP Checksum	[RFC-1146]
1	8-bit Fletchers's algorithm	[RFC-1146]
2	16-bit Fletchers's algorithm	[RFC-1146]
3	Redundant Checksum Avoidance	[Kay]

TELNET OPTIONS

The Telnet Protocol has a number of options that may be negotiated. These options are listed here. "Internet Official Protocol Standards" (STD 1) provides more detailed information.

Options	Name	References
0	Binary Transmission	[RFC856,JBP]
1	Echo	[RFC857,JBP]
1 2 3 4	Reconnection	[NIC50005, JBP]
3	Suppress Go Ahead	[RFC858, JBP]
4	Approx Message Size Negotiation	[ETHERNET, JBP]
5 6 7	Status	[RFC859, JBP]
<u>6</u>	Timing Mark	[RFC860, JBP]
/	Remote Controlled Trans and Echo	[RFC726, JBP]
8	Output Line Width	[NIC50005, JBP]
9	Output Page Size	[NIC50005, JBP]
10	Output Carriage-Return Disposition	[RFC652, JBP]
11	Output Horizontal Tab Stops	[RFC653, JBP]
12 13	Output Horizontal Tab Disposition	[RFC654, JBP]
13 14	Output Formfeed Disposition	[RFC655, JBP]
14 15	Output Vertical Tabstops Output Vertical Tab Disposition	[RFC656, JBP]
15 16	Output Linefeed Disposition	[RFC657,JBP] [RFC657,JBP]
17	Extended ASCII	[RFC698,JBP]
18	Logout	[RFC727,MRC]
19	Byte Macro	[RFC735,JBP]
20	Data Entry Terminal	[RFC1043,RFC732,JBP]
22	SUPDUP	[RFC736,RFC734,MRC]
2 2	SUPDUP Output	[RFC749,MRC]
<u></u>	Send Location	[RFC779,ÉAK1]

TYPE

DOMAIN NAME SYSTEM PARAMETERS

The Internet Domain Naming System (DOMAIN) includes several parameters. These are documented in [RFC1034] and [RFC1035]. The CLASS parameter is listed here. The per CLASS parameters are defined in separate RFCs as indicated.

Domain System Parameters:

Decimal	Name	References
0	Reserved	[PM1]
1	Internet (IN)	[RFC1034,PM1]
2	Unassigned	[PM1]
3	Chaos (CH)	[PM1]
4	Hessoid (HS)	[PM1]
5-65534	Unassigned	[PM1]
65535	Reserved	[PM1]

value and meaning

In the Internet (IN) class the following TYPEs and QTYPEs are defined:

IIFL	value and meaning	
A NS MD MF CNAME SOA MB MG MR NULL WKS PTR HINFO MINFO MX TXT	1 a host address 2 an authoritative name server 3 a mail destination (Obsolete - use MX) 4 a mail forwarder (Obsolete - use MX) 5 the canonical name for an alias 6 marks the start of a zone of authority 7 a mailbox domain name (EXPERIMENTAL) 8 a mail group member (EXPERIMENTAL) 9 a mail rename domain name (EXPERIMENTAL) 10 a null RR (EXPERIMENTAL) 11 a well known service description 12 a domain name pointer 13 host information 14 mailbox or mail list information 15 mail exchange 16 text strings	[RFC1035] [RFC1035] [RFC1035] [RFC1035] [RFC1035]
RP AFSDB X25 ISDN RT	17 for Responsible Person 18 for AFS Data Base location 19 for X.25 PSDN address 20 for ISDN address 21 for Route Through	[RFC1183] [RFC1183] [RFC1183] [RFC1183] [RFC1183]
NSAP NSAP-PTR	22 for NSAP address, NSAP style A record 23 for domain name pointer, NSAP style	

RFC 1700	Assigned Numbers	October 1994
----------	------------------	--------------

SIG KEY	24 for security signature 25 for security key	[Donald Eastlake] [Donald Eastlake]
PX	26 X.400 mail mapping information	[RFC1664]
GPOS	27 Geographical Position	[Craig Farrell]
AAAA	28 IP6 Address	[Susan Thomson]
	252 transfer of an entire zone 253 mailbox-related RRs (MB, MG o 254 mail agent RRs (Obsolete - se 255 A request for all records

MAIL ENCODING HEADER FIELD KEYWORDS

[RFC1505] specifies an initial list of keywords for the experimental encoding header field (EHF-MAIL), and provides that additional keywords may be registered with the IANA.

Keyword	Description	Reference
EDIFACT	EDIFACT format	[RFC1505]
EDI-X12	EDI X12 format	[ANSI-X12]
EVFU	FORTRAN format	[RFC1505]
FS	File System format	[RFC1505]
Hex	Hex binary format	[RFC1505]
LZJU90	LZJU90 format	[RFC1505]
LZW	LZW format	[RFC1505]
Message	Encapsulated Message	[RFC822]
PEM, PEM-Clear	Privacy Enhanced Mail	[RFC1421]
PGP	Pretty Good Privacy	[RFC1505]
Postscript	Postscript format	[POSTSCRIPT]
Shar	Shell Archive format	[RFC1505]
Signature	Signature	[RFC1505]
<u>T</u> ar	Tar format	[RFC1505]
Text	Text	[<u>I</u> S-10646]
uuencode	uuencode format	[RFC1505]
URL	external URL-reference	[RFC1505]

MAIL ENCRYPTION TYPES

[RFC822] specifies that Encryption Types for mail may be assigned. There are currently no RFC 822 encryption types assigned. Please use instead the Mail Privacy procedures defined in [RFC1421, RFC1422, RFC1423].

ESMTP MAIL KEYWORDS

[RFC1651] specifies that extension to SMTP can be identified with keywords.

Keywords Description Reference

Reynolds & Postel

[Page 83]

SEND	Send as mail	[RFC821]
SOML	Send as mail or terminal	[RFC821]
SAML	Send as mail and terminal	[RFC821]
EXPN	Expand the mailing list	[RFC821]
HELP	Supply helpful information	[RFC821]
TURN	Turn the operation around	[RFC821]
8BITMIME	Use 8-bit data	[RFC1652]
SIZE	Message size declaration	[RFC1653]
VERB	Verbose	[Eric Allman]
ONEX	One message transaction only	[Eric Allman]

MAIL EXTENSION TYPES

The Simple Mail Transfer Protocol [RFC821] specifies a set of commands or services for mail transfer. A general procedure for extending the set of services is defined in [RFC1651]. The set of service extensions is listed here.

Service Ext	EHLO Keyword	Parameters	Verb	Reference
Send	SEND	none	SEND	[RFC821]
Send or Mail	SOML	none	SOML	[RFC821]
Send and Mail	SAML	none	SAML	[RFC821]
Expand	EXPN	none	EXPN	[RFC821]
Help	HELP	none	HELP	[RFC821]
Turn	TURN	none	TURN	[RFC821]
8 Bit MIME	8BITMIME	none	none	[RFC1652]
Size	SIZE	number	none	[RFC1653]

MAIL SYSTEM NAMES

In some places, an identification of other mail systems is used.

One of these is in "The COSINE and Internet X.500 Schema" (section 9.3.18) [RFC1274]. The mail system names listed here are used as the legal values in that schema under the "otherMailbox" attribute "mailboxType" type (which must be a PrintableString).

Another place is in "Mapping between X.400(1988) / ISO 10021 and RFC 822" (section 4.2.2) [RFC1327]. The names listed here are used as

the legal values in that schema under the "std-or-address" attribute "registered-dd-type" type (which must be a "key-string").

Note that key-string = $\langle a-z, A-Z, 0-9, and "-" \rangle$.

Mail System Name Description Reference mcimail MCI Mail

MAIL TRANSMISSION TYPES

The Simple Mail Transfer Protocol [RFC821] and the Standard for the Format of ARPA Internet Text Messages [RFC822] specify that a set of "Received" lines will be prepended to the headers of electronic mail messages as they are transported through the Internet. These received line may optionally include either or both a "via" phrase and/or a "with" phrase. The legal values for the phrases are listed here. The via phrase is intended to indicate the link or physical medium over which the message was transferred. The with phrase is intended to indicate the protocol or logical process that was used to transfer the message.

VIA link types	Description	Reference
UUCP	Unix-to-Unix Copy Program	[???]
WITH protocol ty	ypes Description	Reference
SMTP ESMTP	Simple Mail Transfer Protocol SMTP with Service Extensions	[RFC821] [RFC1651]

BOOTP AND DHCP PARAMETERS

The Bootstrap Protocol (B00TP) [RFC951] describes an IP/UDP bootstrap protocol (B00TP) which allows a diskless client machine to discover its own IP address, the address of a server host, and the name of a file to be loaded into memory and executed. The Dynamic Host Configuration Protocol (DHCP) [RFC1531] provides a framework for automatic configuration of IP hosts. The "DHCP Options and B00TP Vendor Information Extensions" [RFC1533] describes the additions to the Bootstrap Protocol (B00TP) which can also be used as options with the Dynamic Host Configuration Protocol (DHCP).

BOOTP Vendor Extensions and DHCP Options are listed below:

Tag	Name	Data Length	Meaning
0	Pad	0	None
1	Subnet Mask	4	Subnet Mask Value
2	Time Offset	4	Time Offset in Seconds from UTC
3	Gateways	N	N/4 Gateway addresses
4	Time Server	N	N/4 Timeserver addresses
5	Name Server	N	N/4 IEN-116 Server addresses
6	Domain Server		N/4 DNS Server addresses
7	Log Server	N	N/4 Logging Server addresses
3 4 5 6 7 8 9	Quotes Server		N/4 Quotes Server addresses
9	LPR Server	Ň	N/4 Printer Server addresses
10	Impress Serve		N/4 Impress Server addresses
11 11	RLP Server	N N	N/4 RLP Server addresses
<u>12</u>	Hostname	Ň	Hostname string
13	Boot File Siz		Size of boot file in 512 byte
13	DOOL 1 110 512	_	chunks
14	Merit Dump Fi	le	Client to dump and name
	iioi ee samp i e		the file to dump it to
15	Domain Name	N	The DNS domain name of the
	Domach Hame	••	client
16	Swap Server	N	Swap Server addeess
17	Root Path	Ň	Path name for root disk
18	Extension Fil		Path name for more BOOTP info

ADDRESS FAMILY NUMBERS

Several protocols deal with multiple address families. The 16-bit assignments are listed here.

```
Number
           Description
                                                                       Reference
     0
           Reserved
           IP (IP version 4)
IP6 (IP version 6)
     1
     2
     3
           NSAP
           HDLC (8-bit multidrop)
     4
           BBN 1822
802 (includes all 802 media plus Ethernet "canonical format")
     5
     6
     7
           E.163
     8
           E.164 (SMDS, Frame Relay, ATM)
     9

FOOBAR AF NUMBERS

In the FTP Operation Over Big Address Records (FOOBAR) Protocol [RFC1639] there is a field, called "address family" or "af", to identify the lower level protocol addresses in use. This is an 8 bit field. The first 16 assignments (0-15) of the af value are exactly the same as the IP Version number. The assignment for values 16-255 are listed here.

Assigned FOOBAR Address Families

Decimal	Keyword	Address Family	References
16	IPX	Novell IPX	
17-254		Unassigned	
255		Reserved

DIRECTORY SYSTEM NAMES

In the representation of distinquished names (and possibly other contexts) of the X.500 Directory system, several unique keywords may be necessary. For example, in the string representation of distinguished names [RFC1485].

Keyword	Attribute (X.520 keys)
CN	CommonName
L	LocalityName
ST	StateOrProvinceName
0	OrganizationName
0U	OrganizationalUnitName
C	CountryName

OSPF AUTHENTICATION CODES

The Open Shotrest Path First (OSPF) protocols has a provision for authentication, and the type of authentication can me indicated by a code number. The following are the registered authentication codes.

Code	Authentication Method	Reference
0	No Authentication	[RFC1583]
1	Simple Password Authentication	[RFC1583]
2-6553	5 Reserved

CHARACTER SETS

These are the official names for character sets that may be used in the Internet and may be referred to in Internet documentation. These names are expressed in ANSI_X3.4-1968 which is commonly called US-ASCII or simply ASCII. The character set most commonly use in the Internet and used especially in protocol standards is US-ASCII, this is strongly encouraged. The use of the name US-ASCII is also encouraged.

The character set names may be up to 40 characters taken from the printable characters of US-ASCII. However, no distinction is made between use of upper and lower case letters.

Character Set

Reference

[RFC1345,KXS2]

Name: ANSI X3.4-1968 Source: ECMA registry

Alias: iso-ir-6 Alias: ANSI_X3.4-1986

Alias: ISO_646.irv:1991 Alias: ASCĪI Alias: ISO646-US Alias: US-ASCII

Alias: us Alias: IBM367 Alias: cp367

Name: ISO-10646-UCS-2

Source: the 2-octet Basic Multilingual Plane, aka Unicode

this needs to specify network byte order: the standard

does not specify (it is a 16-bit integer space)

Name: ISO-10646-UCS-4

Source: the full code space. (same comment about byte order,

these are 31-bit numbers.

Name: ISO-10646-UTF-1

Source: Universal Transfer Format (1), this is the multibyte encoding, that subsets ASCII-7. It does not have byte

ordering issues.

Name: ISO 646.basic:1983

NETWORK MANAGEMENT PARAMETERS

For the management of hosts and gateways on the Internet a data structure for the information has been defined. This data structure should be used with any of several possible management protocols, such as the "Simple Network Management Protocol" (SNMP) [RFC1157], or the "Common Management Information Protocol over TCP" (CMOT) [RFC1095].

The data structure is the "Structure and Indentification of Management Information for TCP/IP-based Internets" (SMI) [RFC1155], and the "Management Information Base for Network Management of TCP/IP-based Internets" (MIB-II) [RFC1213].

The SMI includes the provision for panrameters or codes to indicate experimental or private data structures. These parameter assignments are listed here.

The older "Simple Gateway Monitoring Protocol" (SGMP) [RFC1028] also defined a data structure. The parameter assignments used with SGMP are included here for historical completeness.

The network management object identifiers are under the iso (1), org (3), dod (6), internet (1), or 1.3.6.1, branch of the name space.

The major branches are:

```
1
                     iso
1.3
1.3.6
                     org
                     dod
1.3.6.1
                     internet
1.3.6.1.1
                     directory
1.3.6.1.2
                     mamt
1.3.6.1.2.1
                     mib-2
1.3.6.1.2.1.2.2.1.3 ifType
1.3.6.1.2.1.10
                     transmission
1.3.6.1.2.1.10.23
                     transmission.ppp
1.3.6.1.2.1.27
                     application
1.3.6.1.2.1.28
                     mta
1.3.6.1.3
                     experimental
1.3.6.1.4
                     private
1.3.6.1.4.1
                     enterprise
1.3.6.1.5
                     security
                     SNMPv2
1.3.6.1.6
1.3.6.1.7
                     mail
```

(1.3.6.1.2.1.27.2.1.3)

assocApplicationProtocol OBJECT-TYPE SYNTAX OBJECT IDENTIFIER MAX-ACCESS read-only

STATUS current DESCRIPTION

"An identification of the protocol being used for the application. For an OSI Application, this will be the Application Context. For Internet applications, the IANA maintains a registry of the OIDs which correspond to well-known applications. If the application protocol is not listed in the registry, an OID value of the form {applTCPProtoID port} or {applUDProtoID port} are used for TCP-based and UDP-based protocols, respectively. In either case 'port' corresponds to the primary port number being used by the protocol."

0	 Reserved	
(1.3.6.1.	2.1.27.3)	
(1.3.6.1.	2.1.27.4)	

- -- OIDs of the form {applTCPProtoID port} are intended to be used -- for TCP-based protocols that don't have OIDs assigned by other
- -- means. {applUDPProtoID port} serves the same purpose for
- -- UDP-based protocols. In either case 'port' corresponds to
 -- the primary port number being used by the protocol. For example,
 -- assuming no other OID is assigned for SMTP, an OID of
 -- {applTCPProtoID 25} could be used, since SMTP is a TCP-based

- -- protocol that uses port 25 as its primary port.

ADDRESS RESOLUTION PROTOCOL PARAMETERS

The Address Resolution Protocol (ARP) specified in [RFC826] has several parameters. The assigned values for these parameters are listed here.

REVERSE ADDRESS RESOLUTION PROTOCOL OPERATION CODES

The Reverse Address Resolution Protocol (RARP) specified in [RFC903] uses the "Reverse" codes below.

DYNAMIC REVERSE ARP

The Dynamic Reverse Address Resolution Protocol (DRARP) uses the "DRARP" codes below. For further information, contact: David Brownell (suneast!helium!db@Sun.COM).

INVERSE ADDRESS RESOULUTION PROTOCOL

The Inverse Address Resolution Protocol (IARP) specified in [RFC1293] uses the "InARP" codes below.

Assignments:

Number	Operation Code (op)	Reference
1	REQUEST	[RFC826]
2	REPLY	[RFC826]
3	request Reverse	[RFC903]
4	reply Reverse	[RFC903]
5	DRARP-Request	[David Brownell]
6	DRARP-Reply	[David Brownell]
7	DRARP-Error	[David Brownell]
8	InARP-Request	[RFC1293]
9	InARP-Reply	[RFC1293]
10	ARP-NAK	[Mark Laubach]

Number	Hardware Type (hrd)	References
1	Ethernet (10Mb)	[JBP]
2	Experimental Ethernet (3Mb)	[JBP]
3	Amateur Radio AX.25	[PXK]
4	Proteon ProNET Token Ring	[JBP]

IEEE 802 NUMBERS OF INTEREST

Some of the networks of all classes are IEEE 802 Networks. These systems may use a Link Service Access Point (LSAP) field in much the same way the MILNET uses the "link" field. Further, there is an extension of the LSAP header called the Sub-Network Access Protocol (SNAP).

The IEEE likes to describe numbers in binary in bit transmission order, which is the opposite of the big-endian order used throughout the Internet protocol documentation.

Assignments:

Link Service Acces	s Point	Description	References
IEEE Internet			
binary binary	decimal		
00000000 00000000	0	Null LSAP	[IEEE]
01000000 00000010	2	Indiv LLC Sublayer Mgt	ŢIEEEŢ
11000000 00000011	3	Group LLC Sublayer Mgt	[IEEE]
00100000 00000100	4	SNA Þath Control	ŢIEEEŢ
01100000 00000110	6	Reserved (DOD IP)	[RFC768, JBP]
01110000 00001110	14	PROWAY-LAN	ΓΊΕΕΕΊ
01110010 01001110	78	EIA-RS 511	[IEEE]
01111010 01011110	94	ISI IP	[JBP]
01110001 10001110	142	PROWAY-LAN	[ĬEEE]
01010101 10101010	170	SNAP	ÎIEEEÎ
01111111 11111110	254	ISO CLNS IS 8473	[RFC926,JXJ]
11111111 11111111	255	Global DSAP	[IEEE]

These numbers (and others) are assigned by the IEEE Standards Office. The address is:

IEEE Registration Authority c/o Iris Ringel IEEE Standards Dept 445 Hoes Lane, P.O. Box 1331 Piscataway, NJ 08855-1331 Phone +1 908 562 3813 Fax: +1 908 562 1571

The fee is \$1000 and it takes 10 working days after receipt of the request form and fee. They will not do anything via fax or phone.

At an ad hoc special session on "IEEE 802 Networks and ARP", held during the TCP Vendors Workshop (August 1986), an approach to a

Reynolds & Postel

[Page 166]

consistent way to send DoD-IP datagrams and other IP related protocols (such as the Address Resolution Protocol (ARP)) on 802 networks was developed, using the SNAP extension (see [RFC1042]).

ETHER TYPES

Many of the networks of all classes are Ethernets (10Mb) or Experimental Ethernets (3Mb). These systems use a message "type" field in much the same way the ARPANET uses the "link" field.

If you need an Ether Type, contact:

Xerox Systems Institute 3400 Hillview Ave. PO BOX 10034 Palo Alto, CA 94303

Phone: 415-813-7164

Contact: Fonda Lix Pallone

The following list of EtherTypes is contributed unverified information from various sources.

The standard for transmission of IP datagrams over Ethernets and Experimental Ethernets is specified in [RFC894] and [RFC895] respectively.

NOTE: Ethernet 48-bit address blocks are assigned by the IEEE.

IEEE Registration Authority c/o Iris Ringel
IEEE Standards Department
445 Hoes Lane, P.O. Box 1331
Piscataway, NJ 08855-1331
Phone +1 908 562 3813
Fax: +1 908 562 1571

IANA ETHERNET ADDRESS BLOCK

The IANA owns an Ethernet address block which may be used for multicast address asignments or other special purposes.

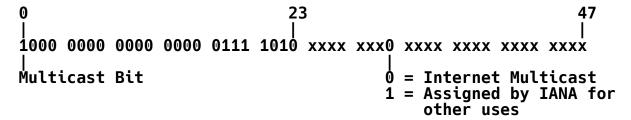

The address block in IEEE binary is: 0000 0000 0000 0000 0111 1010

In the normal Internet dotted decimal notation this is 0.0.94 since the bytes are transmitted higher order first and bits within bytes are transmitted lower order first (see "Data Notation" in the Introduction).

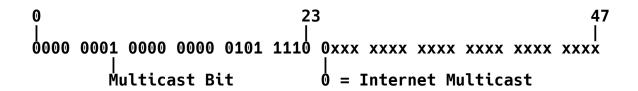

IEEE CSMA/CD and Token Bus bit transmission order: 00 00 5E

IEEE Token Ring bit transmission order: 00 00 7A

Appearance on the wire (bits transmitted from left to right):

Appearance in memory (bits transmitted right-to-left within octets, octets transmitted left-to-right):

Reynolds & Postel

[Page 172]

1 = Assigned by IANA for other uses

The latter representation corresponds to the Internet standard bit-order, and is the format that most programmers have to deal with. Using this representation, the range of Internet Multicast addresses is:

01-00-5E-00-00-00 to 01-00-5E-7F-FF in hex, or 1.0.94.0.0.0 to 1.0.94.127.255.255 in dotted decimal

ETHERNET VENDOR ADDRESS COMPONENTS

Ethernet hardware addresses are 48 bits, expressed as 12 hexadecimal digits (0-9, plus A-F, capitalized). These 12 hex digits consist of the first/left 6 digits (which should match the vendor of the Ethernet interface within the station) and the last/right 6 digits which specify the interface serial number for that interface vendor.

Ethernet addresses might be written unhyphenated (e.g., 123456789ABC), or with one hyphen (e.g., 123456-789ABC), but should be written hyphenated by octets (e.g., 12-34-56-78-9A-BC).

These addresses are physical station addresses, not multicast nor broadcast, so the second hex digit (reading from the left) will be even, not odd.

At present, it is not clear how the IEEE assigns Ethernet block addresses. Whether in blocks of 2**24 or 2**25, and whether multicasts are assigned with that block or separately. A portion of the vendor block address is reportedly assigned serially, with the other portion intentionally assigned randomly. If there is a global algorithm for which addresses are designated to be physical (in a chipset) versus logical (assigned in software), or globally-assigned versus locally-assigned addresses, some of the known addresses do not follow the scheme (e.g., AA0003; 02xxxx).

ETHERNET MULTICAST ADDRESSES

An Ethernet multicast address consists of the multicast bit, the 23-bit vendor component, and the 24-bit group identifier assigned by the vendor. For example, DEC is assigned the vendor component 08-00-2B, so multicast addresses assigned by DEC have the first 24-bits 09-00-2B (since the multicast bit is the low-order bit of the first byte, which is "the first bit on the wire").

Type

Address	Field	Usage
Multicast Addresses:		
01-00-5E-00-00-00- 01-00-5E-7F-FF-FF	0800	Internet Multicast [RFC1112]

X.25 TYPE NUMBERS

CCITT defines the high order two bits of the first octet of call user data as follows:

- 00 Used for other CCITT recomendations (such as X.29)
 01 Reserved for use by "national" administrative authorities
- 10 Reserved for use by international administrative authoorities
- 11 Reserved for arbitrary use between consenting DTEs

Call User Data (hex)	Protocol	Reference
•		
01	PAD	[GS2]
C5	Blacker front-end descr	dev [AGM]
CC	IP	[RFC877,AGM]*
CD	ISO-IP	[AGM]
CF	PPP	[RFC1598]
DD	Network Monitoring	[AGM]

*NOTE: ISO SC6/WG2 approved assignment in ISO 9577 (January 1990).

MILNET LINK NUMBERS

The word "link" here refers to a field in the original MILNET Host/IMP interface leader. The link was originally defined as an 8-bit field. Later specifications defined this field as the "message-id" with a length of 12 bits. The name link now refers to the high order 8 bits of this 12-bit message-id field. The Host/IMP interface is defined in BBN Report 1822 [BBN1822].

The low-order 4 bits of the message-id field are called the sub-link. Unless explicitly specified otherwise for a particular protocol, there is no sender to receiver significance to the sub-link. The sender may use the sub-link in any way he chooses (it is returned in the RFNM by the destination IMP), the receiver should ignore the sub-link.

Link Assignments:

Decimal	Description	References
Decimal 0-63 64-149 150 151 152 153 154 155 156-158 159 160 161-194 195 196-247	BBNCC Monitoring Unassigned Xerox NS IDP Unassigned PARC Universal Protocol TIP Status Reporting TIP Accounting Internet Protocol [regular] Internet Protocol [experimental] Figleaf Link Blacker Local Network Protocol Unassigned ISO-IP Experimental Protocols	RETERENCES [MB] [JBP] [ETHERNET, XEROX] [JBP] [PUP, XEROX] [JGH] [JGH] [RFC791, JBP] [RFC791, JBP] [DM28] [DM28] [JBP] [RFC926, RXM]

MILNET LOGICAL ADDRESSES

The MILNET facility for "logical addressing" is described in [RFC878] and [RFC1005]. A portion of the possible logical addresses are reserved for standard uses.

There are 49,152 possible logical host addresses. Of these, 256 are reserved for assignment to well-known functions. Assignments for well-known functions are made by the IANA. Assignments for other

Reynolds & Postel

[Page 186]

logical host addresses are made by the NIC.

Logical Address Assignments:

Decimal	Description	References
0	Reserved	[JBP]
1	The BBN Core Gateways	-ŢMBŢ
2-254	Unassigned	ΓĴΒΡĪ
255	Reserved	[JBP]

MILNET X.25 ADDRESS MAPPINGS

All MILNET hosts are assigned addresses by the Defense Data Network (DDN). The address of a MILNET host may be obtained from the Network Information Center (NIC), represented as an ASCII text string in what is called "host table format". This section describes the process by which MILNET X.25 addresses may be derived from addresses in the NIC host table format.

A NIC host table address consists of the ASCII text string representations of four decimal numbers separated by periods, corresponding to the four octeted of a thirty-two bit Internet address. The four decimal numbers are referred to in this section as "n", "h' "l", and "i". Thus, a host table address may be represented as: "n.h.l.i". Each of these four numbers will have either one, two, or three decimal digits and will never have a value greater than 255. For example, in the host table, address: "10.2.0.124", n=10, h=2, l=0, and i=124. To convert a host table address to a MILNET X.25 address:

1. If h < 64, the host table address corresponds to the X.25 physical address:

ZZZZ F IIIHHZZ (SS)

where:

ZZZZ = 0000 as required
F = 0 because the address is a physical address;
III is a three decimal digit respresentation of
"i", right-adjusted and padded with leading

Reynolds & Postel

[Page 187]

zeros if required;

is a two decimal digit representation of "h", HH

right-adjusted and padded with leading zeros

if required:

ZZ = 00and

is optional (SS)

In the example given above, the host table address 10.2.0.124 corresponds to the X.25 physical address 000001240200.

2. If h > 64 or h = 64, the host table address corresponds to the X.25 logical address

ZZZZ F RRRRRZZ (SS)

where:

ZZZZ = 0000as required

F = 1because the address is a logical address;

is a five decimal digit representation of the result "r" of the calculation RRRRR

r = h * 256 + i

(Note that the decimal representation of "r" will always require five digits);

ZZ = 00and

(SS) is optional

Thus, the host table address 10.83.0.207 corresponds to the X.25 logical address 000012145500.

In both cases, the "n" and "l" fields of the host table address are not used.

INTERNET / XNS PROTOCOL MAPPINGS

Below are two tables describing the arrangement of protocol fields or type field assignments so that one could send XNS Datagrams on the MILNET or Internet Datagrams on 10Mb Ethernet, and also protocol and type fields so one could encapsulate each kind of Datagram in the other.

upper lower	DoD IP	PUP	NS IP	
3Mb Ethernet	Type 1001 octal	Type 1000 octal	Type 3000 octal	
10 Mb Ethernet	Type 0800 hex	Type 0200 hex	Type 0600 hex	
MILNET	Link 155 decimal	Link 152 decimal	Link 150 decimal	
	1		1	1

upper lower	DoD IP	PUP	NS IP
DoD IP	Х	12	Protocol 22 decimal
PUP	?	x	?
NS IP	Type 13 decimal	Type 12 decimal	X

PRONET 80 TYPE NUMBERS

Below is the current list of PRONET 80 Type Numbers. Note: a protocol that is on this list does not necessarily mean that there is any implementation of it on ProNET.

Of these, protocols 1, 14, and 20 are the only ones that have ever been seen in ARP packets.

For reference, the header is (one byte/line):

```
destination hardware address
source hardware address
data link header version (2)
data link header protocol number
data link header reserved (0)
data link header reserved (0)
```

Some protocols have been known to tuck stuff in the reserved fields.

Those who need a protocol number on ProNET-10/80 should contact John Shriver (jas@proteon.com).

[Page 199]

POINT-TO-POINT PROTOCOL FIELD ASSIGNMENTS

PPP DLL PROTOCOL NUMBERS

The Point-to-Point Protocol (PPP) Data Link Layer [146,147,175] contains a 16 bit Protocol field to identify the the encapsulated protocol. The Protocol field is consistent with the ISO 3309 (HDLC) extension mechanism for Address fields. All Protocols MUST be assigned such that the least significant bit of the most significant octet equals "0", and the least significant bit of the least significant octet equals "1".

Assigned PPP DLL Protocol Numbers

Value (in hex) Protocol Name

0001 0003 to 001f 0021 0023 0025 0027 0029 002b 002d 002f 0031 0033 0035 0037 0039 003b 003d 003f 0041 0043 0045 0049	Internet Protocol OSI Network Layer Xerox NS IDP DECnet Phase IV Appletalk Novell IPX Van Jacobson Compressed TCP/IP Van Jacobson Uncompressed TCP/IP Bridging PDU Stream Protocol (ST-II) Banyan Vines reserved (until 1993) AppleTalk EDDP AppleTalk SmartBuffered Multi-Link NETBIOS Framing Cisco Systems Ascom Timeplex Fujitsu Link Backup and Load Balancing (LBLB) DCA Remote Lan Serial Data Transport Protocol (PPP-SDTP) SNA over 802.2

c021 c023 c025 c027 c029 c081 c223	Link Control Protocol Password Authentication Protocol Link Quality Report Shiva Password Authentication Protocol CallBack Control Protocol (CBCP) Container Control Protocol Challenge Handshake Authentication Pro	[KEN]

c26f Stampede Bridging Authorization Protocol c481 Proprietary Node ID Authentication Protocol [KEN]

Protocol field values in the "0xxx" to "3xxx" range identify the network-layer protocol of specific datagrams, and values in the "8xxx" to "bxxx" range identify datagrams belonging to the associated Network Control Protocol (NCP), if any.

It is recommended that values in the "02xx" to "1exx" and "xx01" to "xx1f" ranges not be assigned, as they are compression inefficient.

Protocol field values in the "4xxx" to "7xxx" range are used for protocols with low volume traffic which have no associated NCP.

Protocol field values in the "cxxx" to "exxx" range identify datagrams as Control Protocols (such as LCP).

PPP LCP AND IPCP CODES

The Point-to-Point Protocol (PPP) Link Control Protocol (LCP), [146] the Compression Control Protocol (CCP), Internet Protocol Control Protocol (IPCP), [147] and other control protocols, contain an 8 bit Code field which identifies the type of packet. These Codes are assigned as follows:

Code	Packet Type
1	Configure-Request
2	Configure-Ack
3	Configure-Nak
4	Configure-Reject
5	Terminate-Request
6	Terminate-Ack
7	Code-Reject
8 *	Protocol-Reject
9 *	=======================================
10 *	Echo-Reply
11 *	Discard-Request
12 *	Identification
13 *	Time-Remaining
14 +	Reset-Request
15 +	_

* LCP Only + CCP Only

PPP LCP CONFIGURATION OPTION TYPES

The Point-to-Point Protocol (PPP) Link Control Protocol (LCP) specifies a number of Configuration Options [146] which are distinguished by an 8 bit Type field. These Types are assigned as follows:

Type	Configuration Option
1	Maximum-Receive-Unit
2	Async-Control-Character-Map
3	Authentication-Protocol
4	Quality-Protocol
5	Magic-Number
6	REŠERVED
7	Protocol-Field-Compression
8	Address-and-Control-Field-Compression
ğ	FCS-Alternatives
1 2 3 4 5 6 7 8 9 10	Self-Describing-Pad
11 11	Numbered-Mode
12	Multi-Link-Procedure
13	Callback
14	Connect-Time
15	Compound-Frames
16	Nominal-Data-Encapsulation
17	Multilink-MRRU
18	Multilink-Short-Sequence-Number-Header-Format
19	Multilink-Endpoint-Discriminator
20	Proprietary [KEN]
21	DCE-Identifier [SCHNEIDER]

PPP LCP FCS-ALTERNATIVES

The Point-to-Point Protocol (PPP) Link Control Protocol (LCP) FCS-Alternatives Configuration Option contains an 8-bit Options field which identifies the FCS used. These are assigned as follows:

Bit	FCS
1	Null FCS
2	CCITT 16-Bit FCS
4	CCITT 32-bit FCS

PPP LCP CALLBACK OPERATION FIELDS

The Point-to-Point Protocol (PPP) Link Control Protocol (LCP) Callback Configuration Option contains an 8-bit Operations field which identifies the format of the Message. These are assigned as follows:

Operation Description O Location determined by user authentication. Dialing string. Location identifier.

3 E.164 number.

4 X.500 distinguished name.

5 unassigned

6 Location is determined during CBCP negotiation.

PPP IPCP CONFIGURATION OPTION TYPES

The Point-to-Point Protocol (PPP) Internet Protocol Control Protocol (IPCP) specifies a number of Configuration Options [147] which are distinguished by an 8 bit Type field. These Types are assigned as follows:

Type	Configuration Option
1	<pre>IP-Addresses (deprecated) IP-Compression-Protocol IP-Address</pre>
2	IP-Compression-Protocol
3	IP-Address

PPP ATCP CONFIGURATION OPTION TYPES

The Point-to-Point Protocol (PPP) Apple Talk Control Protocol (ATCP) specifies a number of Configuration Options [RFC-1378] which are distinguished by an 8 bit Type field. These Types are assigned as follows:

Type	Configuration Option
1	AppleTalk-Address
2	Routing-Protocol
3	Suppress-Broadcasts
4	AT-Compression-Protocol
5	Reserved
6	Server-information
7	Zone-information
8	Default-Router-Address

PPP OSINLCP CONFIGURATION OPTION TYPES

The Point-to-Point Protocol (PPP) OSI Network Layer Control Protocol (OSINLCP) specifies a number of Configuration Options [RFC-1377] which are distinguished by an 8 bit Type field. These Types are assigned as follows:

Туре	Configuration Option
1	Align-NPDU

PPP BRIDGING CONFIGURATION OPTION TYPES

The Point-to-Point Protocol (PPP) Bridging Control Protocol (BCP) specifies a number of Configuration Options which are distinguished by an 8 bit Type field. These Types are assigned as follows:

Туре	Configuration Option
1	Bridge-Identification
2	Line-Identification
3	MAC-Support
4	Tinygram-Compression LAN-Identification
5	LAN-Identification
6	MAC-Address
7	Spanning-Tree-Protocol

PPP BRIDGING MAC TYPES

The Point-to-Point Protocol (PPP) Bridging Control Protocol (BCP) contains an 8 bit MAC Type field which identifies the MAC encapsulated. These Types are assigned as follows:

Type	MAC	
0	Reserved	
1	IEEE 802.3/Ethernet	with cannonical addresses
2 3	IEEE 802.4	with cannonical addresses
3	IEEE 802.5	with non-cannonical addresses
4	FDDI	with non-cannonical addresses
5-10	reserved	
11	IEEE 802.5	with cannonical addresses
12	FDDI	with cannonical addresses

PPP BRIDGING SPANNING TREE

The Point-to-Point Protocol (PPP) Bridging Control Protocol (BCP) Spanning Tree Configuration Option contains an 8-bit Protocol field which identifies the spanning tree used. These are assigned as follows:

Protocol	Spanning Tree
0	Null - no spanning tree protocol supported
1	IEEE 802.1D spanning tree protocol

- IEEE 802.1G extended spanning tree protocol IBM source route spanning tree protocol DEC LANbridge 100 spanning tree protocol 2 3
- 4

MACHINE NAMES

These are the Official Machine Names as they appear in the Domain Name System HINFO records and the NIC Host Table. Their use is described in [RFC952].

A machine name or CPU type may be up to 40 characters taken from the set of uppercase letters, digits, and the two punctuation characters hyphen and slash. It must start with a letter, and end with a letter or digit.
