Network Working Group Request for Comments: 4231 Category: Standards Track M. Nystrom RSA Security December 2005

Identifiers and Test Vectors for HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512

## Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

# Copyright Notice

## **Abstract**

This document provides test vectors for the HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 message authentication schemes. It also provides ASN.1 object identifiers and Uniform Resource Identifiers (URIs) to identify use of these schemes in protocols. The test vectors provided in this document may be used for conformance testing.

# 1. Introduction

This document provides test vectors for the HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 message authentication schemes. It also provides ASN.1 object identifiers and URIs to identify use of these schemes in protocols using ASN.1 constructs (such as those built on Secure/Multipurpose Internet Mail Extensions (S/MIME) [4]) or protocols based on XML constructs (such as those leveraging XML Digital Signatures [5]).

HMAC-SHA-224 is the realization of the HMAC message authentication code [1] using the SHA-224 hash function, HMAC-SHA-256 is the realization of the HMAC message authentication code using the SHA-256 hash function, HMAC-SHA-384 is the realization of the HMAC message authentication code using the SHA-384 hash function, and HMAC-SHA-512 is the realization of the HMAC message authentication code using the SHA-512 hash function. SHA-224, SHA-256, SHA-384, and SHA-512 are all described in [2].

# 2. Conventions Used in This Document

The key word "SHOULD" in this document is to be interpreted as described in RFC 2119 [3].

## 3. Scheme Identifiers

# 3.1. ASN.1 Object Identifiers

The following ASN.1 object identifiers have been allocated for these schemes:

## 3.2. Algorithm URIs

type NULL.

The following URIs have been allocated for these schemes:

```
http://www.rsasecurity.com/rsalabs/pkcs/schemas/pkcs-5#hmac-sha-224
http://www.rsasecurity.com/rsalabs/pkcs/schemas/pkcs-5#hmac-sha-256
http://www.rsasecurity.com/rsalabs/pkcs/schemas/pkcs-5#hmac-sha-384
http://www.rsasecurity.com/rsalabs/pkcs/schemas/pkcs-5#hmac-sha-512
```

As usual, when used in the context of [5], the <ds:HMACOutputLength> element may specify the truncated length of the scheme output.

#### 4. Test Vectors

### 4.1. Introduction

The test vectors in this document have been cross-verified by three independent implementations. An implementation that concurs with the results provided in this document should be interoperable with other similar implementations.

Keys, data, and digests are provided in hex.

# 4.2. Test Case 1

RFC 4231

Key = 0b0b0b0b0b0b0b0b0b0b0b0b0b0b0b0b

# 5. Security Considerations

This document is intended to provide the identifications and test vectors for the four identified message authentication code schemes to the Internet community. No assertion of the security of these message authentication code schemes for any particular use is intended. The reader is referred to [1] for a discussion of the general security of the HMAC construction.

a678cc31e799176d3860e6110c46523e

debd71f8867289865df5a32d20cdc944 b6022cac3c4982b10d5eeb55c3e4de15 134676fb6de0446065c97440fa8c6a58

HMAC-SHA-512 = e37b6a775dc87dbaa4dfa9f96e5e3ffd

# 6. Acknowledgements

The test cases in this document are derived from the test cases in [6], although the keys and data are slightly different.

Thanks to Jim Schaad and Brad Hards for assistance in verifying the results.
