Signaling MIB for PacketCable and IPCablecom Multimedia Terminal Adapters (MTAs)

### Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

### Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines a basic set of managed objects for Simple Network Management Protocol (SNMP)-based management of PacketCable-and IPCablecom-compliant Multimedia Terminal Adapter devices.

# 1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

### 2. Introduction

A multimedia terminal adapter (MTA) is used to deliver broadband Internet, data, and/or voice access jointly with telephony service to a subscriber's or customer's premises using a cable network infrastructure. An MTA is normally installed at the customer's or subscriber's premises, and it is coupled to a multiple system operator (MSO) using a hybrid fiber coax (HFC) access network.

An MTA is provisioned by the MSO for broadband Internet, data, and/or voice service. For more information on MTA provisioning, refer to

Beacham, et al.

Standards Track

[Page 2]

the PacketCable Provisioning Specification [PKT-SP-PROV] and [RFC4682]. MTA devices include one or more endpoints (e.g., telephone ports), which receive call signaling information to establish ring cadence, and codecs used for providing telephony service. For more information on call signaling, refer to the PacketCable Signaling Specification [PKT-SP-MGCP] and [RFC3435]. For more information on codecs refer to the PacketCable Audio/Video Codecs Specification [PKT-SP-CODEC].

Telephone systems are typically very complex and often have a wide distribution. It is therefore important for management systems to support MTAs from multiple vendors at the same time, including those from multiple countries. This MIB module provides objects suitable for managing signaling for MTA devices in the widest possible range of markets.

# 3. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

The terms "MIB module" and "information module" are used interchangeably in this memo. As used here, both terms refer to any of the three types of information modules defined in Section 3 of RFC 2578 [RFC2578].

### 3.1. MTA

An MTA is a PacketCable or IPCablecom compliant device providing telephony services over a cable or hybrid system used to deliver video signals to a community. It contains an interface to endpoints, a network interface, codecs, and all signaling and encapsulation functions required for Voice-over IP transport, call signaling, and Quality of Service signaling. An MTA can be an embedded or standalone device. An Embedded MTA (E-MTA) is an MTA device containing an embedded Data Over Cable Service Interface Specifications (DOCSIS) Cable Modem. A Standalone MTA (S-MTA) is an MTA device separated from the DOCSIS Cable Modem by non-DOCSIS Media Access Control (MAC) interface (e.g., Ethernet, USB).

# 3.2. Endpoint

An endpoint or MTA endpoint is a standard telephony physical port located on the MTA and used for attaching the telephone device to the MTA.

# 3.3. L Line Package

The L line package refers to the Media Gateway Control Protocol (MGCP) package for the core signaling functionality, as defined by PacketCable and IPCablecom. An MTA provides all L package elements: however, the operator determines their application.

## 3.4. E Line Package

The E line package refers to the MGCP package extensions, over and above the core L package, defined in support of international requirements. E line package elements are optional, vary from country to country, and are set by operator or regulatory requirements.

### 4. Overview

This MIB module provides a set of objects required for Multimedia Terminal Adapter (MTA) devices compliant with the PacketCable and IPCablecom signaling specifications published by CableLabs, the European Telecommunications Standards Institute (ETSI), and the International Telecommunication Union Telecommunication Standardization Sector (ITU-T) IPCablecom compliant Multimedia Terminal Adapter (MTA) devices. The Signaling MIB module (PKTC-IETF-SIG-MIB) is intended to update various Signaling MIB modules from which it is partly derived:

- the PacketCable 1.0 Signaling MIB Specification [PKT-SP-MIB-SIG-1.0],
- the PacketCable 1.5 Signaling MIB Specification [PKT-SP-MIB-SIG-1.5],
- the ITU-T IPCablecom Signaling MIB requirements [ITU-T-J169].
- the ETSI Signaling MIB [ETSI-TS-101-909-9]. The ETSI Signaling MIB requirements also refer to various signal characteristics defined in [ETSI-TS-101-909-4], [ETSI-EN-300-001], [ETSI-EN-300-659-1], [ETSI-EN-300-324-1] and [ETSI-TR-101-183].

Several normative and informative references are used to help define Signaling MIB objects. As a convention, wherever PacketCable and IPCablecom requirements are equivalent, the PacketCable reference is used in the object REFERENCE clause. IPCablecom compliant MTA devices MUST use the equivalent IPCablecom references.

This MIB module describes the various Signaling MIB objects that are directly related to the PacketCable MTA and the endpoints supported on the MTA, each of which provides services independently. The recognition and distinction of the endpoints are made by utilizing the ifTable (IF-MIB [RFC2863]), where each index (ifIndex) value refers to a unique endpoint. This MIB module also utilizes the syntax definition of the Differentiated Services Code Point (DSCP) from DIFFSERV-DSCP-TC [RFC3289] for defining MIB objects that allow for differentiation between various types of traffic in the service provider network.

### 4.1. Structure of the MIB

This MIB module is identified by pktcIetfSigMib and is structured into two major parts:

- Signaling information that controls device and endpoint configuration (pktcSigMibObjects)
- Module Conformance information(pktcSigConformance)

The following sections explain each part in further detail. It is to be noted that future enhancements to specify Notification Objects are also allowed (pktcSigNotification).

# 4.2. pktcSigMibObjects

This is further divided into device-specific elements (pktcSigDevObjects) and endpoint-specific elements (pktcSigEndPntConfigObjects).

Some highlights of the device-specific elements are as follows:

pktcSigDevCodecTable - this object identifies the codec types available on the device.

pktcSigDevEchoCancellation - this object identifies the capability of echo cancellation on the device.

pktcSigDevSilenceSuppression - this object specifies if the device is capable of silence suppression (Voice Activity Detection).

pktcSigPulseSignalTable - this table selects the various signals used in the application of the metering pulse signal to the twisted pair line.

pktcSigDevToneTable - this table specifies a flexible structure within which to specify all of the tones used in the MTA.

Beacham, et al.

**Standards Track** 

[Page 5]

pktcSigDevMultiFreqToneTable - this table defines the characteristics of tones with multiple frequencies. Each entry in this table represents the frequency reference of a multi-frequency tone.

The endpoint-specific elements are mostly confined to the Endpoint configuration MIB table (pktcSigEndPntConfigTable). This table describes the MTA endPoint configuration. The number of entries in this table represents the number of provisioned endpoints.

# 4.3. pktcSigConformance

pktcSigDeviceGroup - this group contains all the MIB objects that apply on a per-device basis and need to be implemented by an MTA to claim compliance with the specified MIB module.

pktcSigEndpointGroup - this group contains all the MIB objects that apply on a per-endpoint basis and need to be implemented by an MTA to claim compliance with the specified MIB module.

pktcLLinePackageGroup - this group contains the MIB objects that need to be implemented to support the L line package.

pktcELinePackageGroup - this group contains the MIB objects that need to be implemented to support the E line package.

pktcInternationalGroup - this group contains optional MIB objects designed to support operations over the widest possible range of markets.

                  Integer32
PktcCodecType ::= TEXTUAL-CONVENTION
    STATUS
                  current
    DESCRIPTION
         " This TEXTUAL-CONVENTION defines various types of codecs
```

that MAY be supported. The description for each enumeration is listed below:

Enumeration	Description
other	a defined codec not in the enumeration
unknown	a codec not defined by the PacketCable
	Codec Specification
g729	ITU-T Recommendation G.729
reserved	for future use
g729E	ITU-T Recommendation G.729E
pcmu	Pulse Code Modulation u-law (PCMU)
g726at32	ITU-T Recommendation G.726-32 (32 kbit/s)
g728	ITU-T Recommendation G.728
pcma	Pulse Code Modulation a-law (PCMA)
g726at16	ITU-T Recommendation G.726-16 (16 kbit/s)
g726at24	ITU-T Recommendation G.726-24 (24 kbit/s)
	ITU-T Recommendation G.726-40 (40 kbit/s)
g726at40 ilbc	IETF Internet low-bit rate codec
bv16	Broadcom BroadVoice16

The list of codecs is consistent with the IETF Real-Time Transport Protocol (RTP) Profile registry and

the RTP Map Parameters Table in PacketCable Audio/Video Codecs Specification [PKT-SP-CODEC]. The literal codec name for each codec is listed below:

```
Codec
          Literal Codec Name
g729
                   G729
q729E
                   G729E
                   PCMU
pcmu
q726at32
                   G726-32
g728
                   G728
pcma
                   PCMA
                   G726-16
g726at16
                   G726-24
g726at24
g726at40
                   G726-40
ilbc
                   iLBC
bv16
                   BV16
```

The literal codec name is the second column of the table with codec RTP Map Parameters. The Literal Codec Name Column contains the codec name used in the local connection options (LCO) of the NCS messages create connection (CRCX)/modify connection (MDCX) and is also used to identify the codec in the Call Management System (CMS) Provisioning Specification. The RTP Map Parameter column of the Table contains the string used in the media attribute line (a=) of the session description protocol (SDP) parameters in NCS messages."

    DESCRIPTION
```

"This object provides an encoding scheme for ring

Beacham, et al.

**Standards Track** 

cadences, including repeatability characteristics. All fields in this object MUST be encoded in network-byte order.

The first three higher-order octets are reserved. The octets that follow are used to encode a 'bit-string', with each bit corresponding to 50 milliseconds. A bit value of '1' indicates the presence of a ring-tone, and a bit value of '0' indicates the absence of a ring-tone, for that duration (50 ms) (Note: A minimum number of octets required to encode the bit-string MUST be used).

The first two of the reserved octets MUST indicate the length of the encoded cadence (in bits) and MUST range between 1 and 264. (Note: The length in bits MUST also be consistent with the number of octets that encode the cadence). The MTA MUST ignore any unused bits in the last octet, but MUST reflect the value as provided on subsequent SNMP GETs.

The third of the reserved octets indicates 'repeatability' and MUST be either 0x80 or 0x00 -- the former value indicating 'non-repeatability', and the latter indicating 'repeatability'.

The MTA MUST reject attempts to set a value that violates any of the above requirements."

```

"This table describes the MTA-supported codec types. An MTA MUST populate this table with all possible combinations of codecs it supports for simultaneous operation. For example, an MTA with two endpoints may be designed with a particular Digital Signal Processing (DSP) and memory architecture that allows it to support the following fixed combinations of codecs for simultaneous operation:

Codec PCMA	Туре	Maximum	Number	of	Simultaneous ( 3	Codecs
PCMA PCMU					2 1	
PCMA					1	
PCMU					2	
PCMU					3	
PCMA G729					1 1	
G729					2	
PCMU G729					1 1	

Based on this example, the entries in the codec table would be:

pktcSigDev	pktcSigDev	pktcSigDev
CodecComboIndex	CodecType	CodecMax
1	pcma.	3
2	pcma	2
2	pcmu	1

3	pcma	1
3	pcmu	2
4	pcmu	3
5	pcma	1
5	g729	1
6	g729	2
7	pcmu	1
7	q729	1

An operator querying this table is able to determine all possible codec combinations the MTA is capable of simultaneously supporting.

DESCRIPTION

" For on-h

"For on-hook caller id, pktcSigDevCidMode selects the method for representing and signaling caller identification. For the duringRingingETS method, the Frequency Shift Keying (FSK) or the Dual-Tone Multi-Frequency (DTMF) containing the caller identification information is sent between the first and second ring pattern.

For the dtAsETS, rpAsETS, lrAsETS and lrETS methods, the FSK or DTMF containing the caller id information is sent before the first ring pattern.

For the dtAsETS method, the FSK or DTMF is sent after the Dual Tone Alert Signal. For the rpAsETS method, the FSK or DTMF is sent after a Ring Pulse.

For the IrAsETS method, the Line Reversal occurs first, then the Dual Tone Alert Signal, and, finally, the FSK or DTMF is sent.

For the IrETS method, the Line Reversal occurs first, then the FSK or DTMF is sent.

The value of this MIB object MUST NOT persist across MTA reboots."

                  not-accessible
    STATUS
                  current
    DESCRIPTION
         " The Tone Table defines the composition of tones and
           various tone operations.
           The definition of the tones callWaiting1 through
           callWaiting4 in this table MUST only contain the
           audible tone itself; the delay between tones or the value
           of the tone repeat count are not applicable for the call
           waiting tones.
```

The delay between tones or the repeat count is controlled by the objects pktcSigEndPntConfigCallWaitingDelay and pktcSigEndPntConfigCallWaitingMaxRep. If the pktcSigDevToneType is set to either of the values callWaiting1, callWaiting2, callWaiting3, or callWaiting4, then the value of the pktcSigDevToneWholeToneRepeatCount object indicates that the particular frequency group is applicable, as a repeatable part of the tone, based on the value of the MIB object pktcSigDevToneWholeToneRepeatCount.

The MTA MUST make sure that, after the provisioning cycle, the table is fully populated (i.e., for each possible index, an entry MUST be defined) using reasonable defaults for each row that was not defined by the provisioning information delivered via MTA Configuration.

The frequency composition of each tone is defined by the pktcSigDevMultiFreqToneTable. For each tone type defined in pktcSigDevToneTable, the MTA MUST populate at least one entry in the pktcSigDevMultiFreqToneTable.

For each particular value of pktcSigDevToneType, the pktcSigDevToneTable table can define non-repeating and repeating groups of the frequencies defined by the pktcSigDevMultiFreqToneTable, such that each group is represented by the set of the consecutive rows (frequency group) in the pktcSigDevMultiFreqToneTable.

Objects in this table do not persist across MTA reboots. For tones with multiple frequencies refer to the MIB table pktcSigDevMultiFreqToneTable."

    STATUS
                    current
    DESCRIPTION
         "This is the repeat count, which signifies how many times to repeat the entire on-off cadence sequence. Setting this object may result in a cadence duration longer or shorter
           than the overall signal duration specified by the time out
           (TO) object for a particular signal. If the repeat count
           results in a longer tone duration than the signal duration specified by the TO, the tone duration defined by the
          TO object for a particular signal always represents
           the overall signal duration for a tone. In this case, the tone duration repeat count will not be fully exercised, and
           the desired tone duration will be truncated per the TO
           setting. If the repeat count results in a shorter tone
          duration than the signal duration specified by the TO, the
          tone duration defined by the repeat count takes precedence over the TO and will end the signal event. In this case,
```

the TO represents a time not to be exceeded for the signal. It is recommended to ensure proper telephony signaling so that the TO duration setting should always be longer than the desired repeat count-time duration.

::={ pktcSigDevToneEntry 4 }

pktcSigDevToneSteady **OBJECT-TYPE** TruthValue SYNTAX MAX-ACCESS read-only STATUS current DESCRIPTION

> "This MIB object represents the steady tone status. A value of 'true(1)' indicates that the steady tone is applied, and a value of 'false(2)' indicates otherwise. Devices must play out the on-off cadence sequence for the number of times indicated by the MIB object 'pktcSigDevToneWholeToneRepeatCount' prior to applying the last tone steadily, indefinitely. If the MIB table 'pktcSigDevToneTable' contains multiple rows with this Object set to a value of 'true(1)', the steady tone is applied to the last repeating frequency group of the tone.

Setting this MIB object may result in a tone duration that is longer or shorter than the overall signal duration specified by the time out (TO) MIB object for a particular signal. If the repeat count results in a longer tone duration than the signal duration specified by the TO, the tone duration defined by the TO object for a particular signal always represents the overall signal duration for a In this case, the tone duration repeat count will not be fully exercised, and the desired tone duration will be truncated per the TO setting. If the repeat count results in a shorter tone duration than the signal duration specified by the TO, the tone duration defined by the repeat count takes precedence over the TO and will end the signal event. In this case, the TO represents a time not to be exceeded for the signal.

It is recommended to ensure proper telephony signaling that The TO duration setting should always be longer than the desired repeat count-time duration, plus the desired maximum steady tone period."

     DESCRIPTION
     "This MIB object provides directive on the
      modulation or summation of the frequencies
      involved in the tone.
      It is to be noted that while summation can
      be done without any constraint on the number
      of frequencies, the modulation (amplitude) holds good only when there are two frequencies
      (first and second).
      Thus:
        - If the mode is set to a value of
           'firstModulatedBySecond(1)', the first frequency
           MUST be modulated by the second, and the remaining
           frequencies (third and fourth) ignored. The
          percentage of amplitude modulation to be applied is defined by the MIB object
           pktcSigDevToneFreqAmpModePrtg.
        - If the mode is set to a value of
           'summation(2)', all the frequencies MUST be summed without any modulation.

MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This MIB object indicates the number

"This MIB object indicates the number of times to repeat the cadence cycle represented by the on/off durations (refer to the MIB objects pktcSigDevToneFreqOnDuration and pktcSigDevToneFreqOffDuration).

Setting this object may result in a tone duration that is longer or shorter than the overall signal duration specified by the time out (TO) object for the corresponding tone type. If the value of this MIB Object indicates a longer duration than that specified by the TO, the latter overrules the former, and the desired tone duration will be truncated according to the TO.

However, if the repeat count results in a shorter tone duration than the signal duration specified by the TO, the tone duration defined by the repeat count takes precedence over the TO and will end the signal event. In this case, the TO represents a time not to be exceeded for the signal. It is recommended, to ensure proper telephony signaling, that the TO duration setting should always be longer than the desired repeat count-time duration. A value of zero means the tone sequence is to be played once but not repeated."

    DESCRIPTION
           This object contains the default time out value for reorder
           tone. The MTA MUST NOT update this object with the
           value provided in the NCS message (if present). If
           the value of the object is modified by the SNMP Management Station, the MTA MUST use the new value as a default only
           for a new signal requested by the NCS message.
           The time out (TO) elements are intended to limit the time
           a tone or frequency is generated. When this MIB object is set to a value of '0', the MTA MUST NOT generate the
           corresponding frequency or tone, regardless of the
           definitions pertaining to frequency, tone duration, or
           cadence."

# 6. Examples

This section provides a couple of examples, specifically related to the MIB tables pktcSigDevToneTable and pktcSigDevMultiFreqToneTable.

Example A: Call Waiting Tone Defined per [ITU-T E.180]:

```
1) 400 Hz AM modulated by 16 Hz, on for 500ms at -4 dBm 2) 400 Hz AM modulated by 16 Hz, off for 400ms 3) 400 Hz not AM modulated, on for 50 ms at -4 dBm 4) 400 Hz not AM modulated, off for 450 ms 5) 400 Hz not AM modulated, on for 50 ms at -4 dBm 6) 400 Hz not AM modulated, off for 3450 ms 7) 400 Hz not AM modulated, on for 50 ms at -4 dBm 8) 400 Hz not AM modulated, off for 450 ms 9) 400 Hz not AM modulated, off for 3450 ms 10) 400 Hz not AM modulated, off for 3450 ms 11) not repeated, not continuous
```

Assume userDefined1(18) is assigned to this tone:

pktcSigDevMultiFreqToneTable:

ToneType|F-1|F-2|F-3|F-4|F-Mode|ModePrtg|DbL|OnDur|OffDur|Rep-Count

====	=======		===	====	=====	======	======	=====	======	=======
18	400	16	0	0	1	90	-40	<b>500</b>	400	0
18	400	0	0	0	2	0	-40	50	450	0
18	400	0	0	0	2	0	-40	50	3450	0
18	400	0	0	0	2	0	-40	50	450	0
<b>1</b> 8	400	0	0	0	2	0	-40	50	3450	0

pktcSigDevToneTable:

ToneType | ToneFreqGroup | ToneFreqCounter | ToneRep-Count | Steady

18	1	5	0	false(2)

The single row of the pktcSigDevToneTable defines one multi-frequency group of five rows (ToneFreqCounter) defined in the pktcSigDevMultiFreqToneTable and instructs the MTA to play this group only once (non-repeatable as ToneRep-Count equals 0).

Example B - Congestion Tone - congestion(17):

Note: This example of an embedded cadence is based on an operator variation.

- 1) 400Hz on for 400ms -10 dBm
- 2) 400Hz off for 350ms
- 3) 400Hz on for 225ms -4 dBm
- 4) 400Hz off for 525ms
- 5) repeat (1) through (4) 5000 times or TO time out (whichever is the shortest period)

pktcSigDevMultiFreqToneTable:

ToneType|F-1|F-2|F-3|F-4|F-Mode|ModePrtg|DbL|OnDur|OffDur|Rep-Count

17	400	0	0	0	2	0	-100	400	350	0
17	400	0	0	0	2	0	-40	225	525	0

pktcSigDevToneTable:

ToneType | ToneFreqGroup | ToneFreqCounter | ToneRep-Count | Steady

-		 •	•	•	-
17	1	2	5000	) fa	ılse(2)

Beacham, et al.

**Standards Track** 

[Page 70]

Example C - Call Waiting Tone - callWaiting1(9):

- 1) 16 Hz is modulated to carry the 400 Hz signal, ModulationRate within 85%, on for 500msec, at -25 dBm or more but less than -14 dBm
- 2) 16 Hz is modulated to carry the 400 Hz signal, off for 0 ~ 4 secs
- 3) 400 Hz not modulated, on for 50 ms at -25 dBm or more but less than -14 dBm
- 4) 400 Hz not modulated, off for 450ms
- 5) 400 Hz not modulated, on for 50 ms at -25 dBm or more but less than -14 dBm
- 6) 400 Hz not modulated, off for 3450ms ([4000 (50+450+50)])
- 7) Steps 3 thru 6 are repeated

pktcSigDevMultiFreqToneTable:

ToneType|F-1|F-2|F-3|F-4|F-Mode|ModePrtg|DbL|OnDur|OffDur|Rep-Count

9	1	400	16	0	0	1	85	-25	500	1000	0
9	2	400	0	0	0	2	0	-25	<b>50</b>	450	0
9	3	400	0	0	0	2	0	-25	<b>50</b>	3450	0

pktcSigDevToneTable:

ToneType|ToneFreqGroup|ToneFreqCounter|ToneRep-Count|Steady

9	1	1	0	false(2)
9	2	2	1	false(2)

The first row of the pktcSigDevToneTable table instructs the MTA to play one row (ToneFreqCounter) of the pktcSigDevMultiFreqToneTable table only once (non-repeatable as ToneRep-Count equals 0). The second row of the pktcSigDevToneTable table instructs the MTA to play the next two rows (ToneFreqCounter) of the pktcSigDevMultiFreqToneTable table and make this frequency group repeatable (ToneRep-Count is not 0).

# 7. Acknowledgments

The authors would like to thank the members of the IETF IPCDN working group and the CableLabs PacketCable Provisioning focus team for their contributions, comments, and suggestions.

Specifically, the following individuals are recognized:

Angela Lyda **Arris Interactive** Romascanu, Dan Chad Griffiths Avaya Broadcom Corp. Eugene Nechamkin Broadcom Corp. Jean-Francois Mule CableLabs Matt A. Osman CableLabs Klaus Hermanns Cisco Systems, Inc. Rich Woundy Comcast Corp. Bert Wijnen Alcatel-Lucent Randy Presuhn Mindspring Phillip Freyman Motorola, Inc. Motorola, Inc. Motorola, Inc. Rick Vetter Sasha Medvinskv Wim De Ketelaere **tComLabs** David De Reu **tComLabs** Kristof Sercu **tComLabs** Roy Spitzer Telogy Networks, Inc. Itay Sherman Texas Instruments, Inc. Mauricio Sanchez Texas Instruments, Inc. Shivakumar Thangapandi Texas Instruments, Inc. Mike Heard Consultant

The current editor (Sumanth Channabasappa) would like to recognize Phillip Freyman and Eugene Nechamkin for their contributions towards the international objects, and Stephane Bortzmeyer for assistance with the ABNF.

The editor also extends appreciation to the IPCDN co-chairs (Jean-Francois Mule, Rich Woundy) and Dan Romascanu for the numerous reviews and valuable comments. Special appreciation is extended to Bert Wijnen, as the MIB doctor, for his ever-useful and constructive comments.

# 8. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The following Differentiated Services Code Point (DSCP) and mask objects are used to differentiate between various types of traffic in the service provider network:

```
pktcSigDefCallSigDscp
pktcSigDefMediaStreamDscp
```

These objects may contain information that may be sensitive from a business perspective. For example, they may represent a customer's service contract that a service provider chooses to apply to a customer's ingress or egress traffic. If these objects are SET maliciously, it may permit unmarked or inappropriately marked signaling and media traffic to enter the service provider network, resulting in unauthorized levels of service for customers.

The following objects determine ring cadence, repeatable characteristics, signal duration, and caller id subscriber line protocol for telephony operation:

```
pktcSigDevR0Cadence
pktcSigDevR1Cadence
pktcSigDevR3Cadence
pktcSigDevR4Cadence
pktcSigDevR4Cadence
pktcSigDevR5Cadence
pktcSigDevR6Cadence
pktcSigDevR7Cadence
pktcSigDevRgCadence
pktcSigDevRgCadence
pktcSigDevRsCadence
pktcSigDevRsCadence
pktcSigDevCidSigProtocol
pktcSigDevVmwiSigProtocol
pktcSigPulseSignalDuration
pktcSigPulseSignalPauseDuration
```

If these objects are SET maliciously, it may result in unwanted operation, or a failure to obtain telephony service from client (MTA) devices.

The objects in the pktcSigEndPntConfigTable are used for endpoint signaling. The pktcSigEndPntConfigCallAgentId object contains the name of the call agent, which includes the call agent Fully Qualified Domain Name (FQDN). If this object is SET maliciously, the MTA will not be able to communicate with the call agent, resulting in a disruption of telephony service. The pktcSigEndPntConfigCallAgentUdpPort object identifies the UDP port for NCS traffic. If this object is SET maliciously, the call agent will not receive NCS traffic from the MTA, also resulting in a disruption of telephony service.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. The most sensitive is pktcSigEndPntStatusCallIpAddress within pktcSigEndPntConfigTable. This information itself may be valuable to would-be attackers. Other MIB Objects of similar sensitivity include pktcSigEndPntStatusError, which can provide useful information to MTA impersonators, and pktcSigDevCodecMax, which can provide useful information for planning Denial of Service (DoS) attacks on MTAs.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

#### 9. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER value recorded in the SMI Numbers registry:

Descriptor OBJECT IDENTIFIER Value pktcIetfSigMib { mib-2 169 }

# Full Copyright Statement

Copyright (C) The IETF Trust (2008).

This document is subject to the rights, licenses and restrictions contained in BCP 78, and except as set forth therein, the authors retain all their rights.

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY, THE IETF TRUST AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

# **Intellectual Property**

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at http://www.ietf.org/ipr.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.
