MIME Encapsulation of EDI Objects

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Introduction

Electronic Data Interchange (EDI) provides a means of conducting structured transactions between trading partners. The delivery mechanism for these types of transactions in a paper world has been the postal system, so it is to be expected that electronic mail would serve as a natural delivery mechanism for electronic transactions. This specification permits formatted electronic business interchanges to be encapsulated within MIME messages [Bore92]. For the specification effort, the basic building block from EDI is an interchange.

This specification pertains only to the encapsulation of EDI objects within the MIME environment. It intends no changes in those objects from the primary specifications that define the syntax and semantics of them. EDI transactions take place through a variety of carriage and exchange mechanisms. This specification adds to that repertoire, by permitting convenient carriage through Internet email.

Crocker [Page 1]

Since there are many different EDI specifications, the current document defines three distinct categories as three different MIME content-types. One is Application/EDI-X12, indicating that the contents conform to the range of specifications developed through the X12 standards organization [X125, X126, X12V]. Another is Application/EDIFACT, indicating that the contents conform to the range of specifications developed by the United Nations Working Party 4 Group of Experts 1 EDIFACT boards [FACT, FACV]. The last category covers all other specifications; it is Application/EDI-consent.

2. APPLICATION/EDIFACT SPECIFICATION

The Application/EDIFACT MIME body-part contains data as specified for electronic data interchange by [FACT, FACV].

Within EDIFACT, information is specified by:

MIME type name: Application

MIME subtype name: EDIFACT

Required parameters: none

Optional parameters: CHARSET, as defined for MIME

Encoding considerations: May need BASE64 or QUOTED-PRINTABLE

transfer encoding

Security considerations: See separate section in the

document.

Published specification: Contained in the following section.

Rationale: The EDIFACT specifications are

accepted standards for a class of inter-organization transactions; this permits their transmission over the Internet, via email.

Contact-info: See Contact section, below.

Detail specific to MIME-based usage:

This is a generic mechanism for sending any EDIFACT interchange. The object is self-defining, in terms of indicating which specific EDI objects are included. Most EDI data is textual, but special characters such as some delimiters may be non-printable ASCII or some data may be

pure binary. For EDI objects containing such data, the MIME transfer mechanism may need to encode the object in Content-Transfer-Encoding:quoted-printable or base64.

3. APPLICATION/EDI-X12 SPECIFICATION

The Application/EDI-X12 MIME body-part contains data as specified for electronic data interchange by [X125, X12.6, EDIV].

Within MIME, EDI-X12 information is specified by:

MIME type name: Application

MIME subtype name: EDI-X12

Required parameters: none

Optional parameters: CHARSET, as defined for MIME

Encoding considerations: May need BASE64 or QUOTED-PRINTABLE

transfer encoding

Security considerations: See separate section in the

document.

Published specification: Contained in the following section.

Rationale: The ASC X12 EDI specifications are

accepted standards for a class of inter-organization transactions; this permits their transmission over the Internet, via email.

Contact-info: See Contact section, below.

Detail specific to MIME-based usage:

This is a generic mechanism for sending any ASC X12 interchange. The object is self-defining, in terms of indicating which specific EDI objects are included. Most EDI data is textual, but special characters such as some delimiters may be non-printable ASCII or some data may be pure binary. For EDI objects containing such data, the MIME transfer mechanism may need to encode the object in Content-Transfer-Encoding:quoted-printable or base64.

Crocker [Page 3]

APPLICATION/EDI-CONSENT SPECIFICATION 4.

The Application/EDI-consent MIME body-part contains data as specified for electronic data interchange with the consent of explicit. bilateral trading partner agreement exchanging the EDI-consent traffic. As such, use of EDI-consent only provides a standard mechanism for "wrapping" the EDI objects but does not specify any of the details about those objects.

Within MIME, EDI-consent information is specified by:

MIME type name: **Application**

EDI-consent MIME subtype name:

Required parameters: none

Optional parameters: CHARSET, as defined for MIME

Encoding considerations: May need BASE64 or QUOTED-PRINTABLE

transfer encoding

Security considerations: See separate section in the

document.

Published specification: Contained in the following section.

Rationale:

Existing practice for exchanging EDI includes a very wide range of specifications which are not part of the usual, accredited standards world. Nevertheless, this traffic is substantial and well-

established. This content type provides a means of delimiting such

content in a standard fashion.

Contact-info: See Contact section, below.

Detail specific to MIME-based usage:

This is a generic mechanism for sending any EDI object explicitly agreed to by the trading partners. X12 and EDIFACT object must be sent using their assigned MIME content type. EDI-consent is for all other EDI objects, but only according to trading partner agreements between the originator and the recipient. Most EDI data is textual, but special characters such as some delimiters may be non-

Crocker [Page 4] printable ASCII or some data may be pure binary. For EDI objects containing such data, the MIME transfer mechanism may need to encode the object in Content-Transfer-Encoding:quoted-printable or base64.

5. SAMPLE EDI USAGE IN MIME-BASED EMAIL

Actual use of EDI within MIME-based mechanisms requires attention to considerable detail. This section is intended as an example of the gist of the formatting required to encapsulate EDI objects within Internet mail, using MIME. To send a single EDIFACT interchange:

To: <<recipient organization EDI email address>>

Subject:

From: <<sending organization EDI email address>>

Date:

Mime-Version: 1.0

Content-Type: Application/EDIFACT

Content-Transfer-Encoding: QUOTED-PRINTABLE

<<standard EDIFACT Interchange goes here>>

7. SECURITY CONSIDERATIONS

EDI transactions typically include sensitive data, so that transmission often needs to attend to authentication, data integrity, privacy, access control and non-repudiation concerns. This specification permits transmission of such sensitive data via Internet mail and other services which support MIME object encapsulation. For transmission of sensitive data, it is essential that appropriate security services, such as authentication, privacy and/or non-repudiation be provided.

This specification does NOT, itself, provide any security-related mechanisms. As needed and appropriate, such mechanisms MUST be added, either via Internet MIME-based security services or any other services which are appropriate to the user requirements, such as those provided by EDI-based standards.

8. ACKNOWLEDGMENTS

Tom Jones offered introductory text and descriptions of candidate header options. Numerous working group participants provided review and comment, especially Walt Houser, Gail Jackson, and Jim Amster.

10. APPENDIX - MIME FOR EDI USERS

To assist those familiar with EDI but not with Internet electronic mail, this Appendix is provided as a very brief introduction, primarily to give pointers to the relevant specifications. This section is in no way intended to be a thorough introduction. An excellent introductory text is [Rose93].

Internet electronic mail follows the classic user agent/mail transfer agent model. In this model, user software produces a standardized object which is transferred via standard exchange protocols.

An Internet electronic mail object comprises a collection of headers, followed by a (possibly structured) body. The headers specify such information as author and recipient addresses, subject summary, creation date, handling node names, and so on, and are defined by RFC822 and RFC1123 [Croc82, Brad89]. If the body is structured, it conforms to the rules of the Multipurpose Internet Message Exchange (MIME) [Bore92]. A structured body may have parts encoded in different text character sets, or even of entirely different types of data, such as voice or graphics.

The Simple Mail Transfer Protocol (SMTP) [Post82, Brad89] performs the primary task of message transmission. User posting and delivery interactions, between the user agent and the message transfer agent, on the same machine, are not standardized and are platform-specific.

An EDI-related use of Internet Mime email will have (at least) the following components:

Business Program/Data base -> EDI Translator -> -> MIME encapsulation -> RFC822 packaging -> mail submission -> -> SMTP relaying -> -> mail delivery -> RFC822 & Mime stripping -> -> EDI Translator -> Business processing

The first and last lines show components normal to all EDI activities, so that it is only the EDI "transmission" components that are replaced with Internet modules.
