CBOR Object Signing and Encryption (COSE) and JSON Object Signing and
   Encryption (JOSE) Registrations for Web Authentication (WebAuthn)
                              Algorithms

Abstract

   The W3C Web Authentication (WebAuthn) specification and the FIDO
   Alliance FIDO2 Client to Authenticator Protocol (CTAP) specification
   use CBOR Object Signing and Encryption (COSE) algorithm identifiers.
   This specification registers the following algorithms (which are used
   by WebAuthn and CTAP implementations) in the IANA "COSE Algorithms"
   registry: RSASSA-PKCS1-v1_5 using SHA-256, SHA-384, SHA-512, and SHA-
   1; and Elliptic Curve Digital Signature Algorithm (ECDSA) using the
   secp256k1 curve and SHA-256. It registers the secp256k1 elliptic
   curve in the IANA "COSE Elliptic Curves" registry. Also, for use
   with JSON Object Signing and Encryption (JOSE), it registers the
   algorithm ECDSA using the secp256k1 curve and SHA-256 in the IANA
   "JSON Web Signature and Encryption Algorithms" registry and the
   secp256k1 elliptic curve in the IANA "JSON Web Key Elliptic Curve"
   registry.

Status of This Memo

   This is an Internet Standards Track document.

   This document is a product of the Internet Engineering Task Force
   (IETF). It represents the consensus of the IETF community. It has
   received public review and has been approved for publication by the
   Internet Engineering Steering Group (IESG). Further information on
   Internet Standards is available in Section 2 of RFC 7841.

   Information about the current status of this document, any errata,
   and how to provide feedback on it may be obtained at
   https://www.rfc-editor.org/info/rfc8812.

Table of Contents

1. Introduction

   This specification defines how to use several algorithms with CBOR
   Object Signing and Encryption (COSE) [RFC8152] that are used by
   implementations of the W3C Web Authentication (WebAuthn) [WebAuthn]
   and FIDO Alliance FIDO2 Client to Authenticator Protocol (CTAP)
   [CTAP] specifications. This specification registers these algorithms
   in the IANA "COSE Algorithms" registry [IANA.COSE.Algorithms] and
   registers an elliptic curve in the IANA "COSE Elliptic Curves"
   registry [IANA.COSE.Curves]. This specification also registers a
   corresponding algorithm for use with JSON Object Signing and
   Encryption (JOSE) [RFC7515] in the IANA "JSON Web Signature and
   Encryption Algorithms" registry [IANA.JOSE.Algorithms] and registers
   an elliptic curve in the IANA "JSON Web Key Elliptic Curve" registry
   [IANA.JOSE.Curves].

1.1. Requirements Notation and Conventions

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
   "OPTIONAL" in this document are to be interpreted as described in
   BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all
   capitals, as shown here.

2. RSASSA-PKCS1-v1_5 Signature Algorithm

   The RSASSA-PKCS1-v1_5 signature algorithm is defined in [RFC8017].
   The RSASSA-PKCS1-v1_5 signature algorithm is parameterized with a
   hash function (h).

   A key of size 2048 bits or larger MUST be used with these algorithms.

Implementations need to check that the key type is 'RSA' when creating or verifying a signature.

The RSASSA-PKCS1-v1_5 algorithms specified in this document are in the following table.

Name	Value	Hash	Description	Recommended
=======	========	=========	====================	============
RS256	-257	SHA-256	RSASSA-PKCS1-v1_5 using SHA-256	No
RS384	-258	SHA-384	RSASSA-PKCS1-v1_5 using SHA-384	No
RS512	-259	SHA-512	RSASSA-PKCS1-v1_5 using SHA-512	No
RS1	-65535	SHA-1	RSASSA-PKCS1-v1_5 using SHA-1	Deprecated

Table 1: RSASSA-PKCS1-v1_5 Algorithm Values

Security considerations for use of the first three algorithms are in Section 5.2. Security considerations for use of the last algorithm are in Section 5.3.

Note that these algorithms are already present in the IANA "JSON Web Signature and Encryption Algorithms" registry [IANA.JOSE.Algorithms], and so these registrations are only for the IANA "COSE Algorithms" registry [IANA.COSE.Algorithms].

3. Using secp256k1 with JOSE and COSE

This section defines algorithm encodings and representations enabling the Standards for Efficient Cryptography Group (SECG) elliptic curve secp256k1 [SEC2] to be used for JOSE [RFC7515] and COSE [RFC8152] messages.

3.1. JOSE and COSE secp256k1 Curve Key Representations

The SECG elliptic curve secp256k1 [SEC2] is represented in a JSON Web Key (JWK) [RFC7517] using these values:

*   "kty": "EC"
*   "crv": "secp256k1"

plus the values needed to represent the curve point, as defined in Section 6.2.1 of [RFC7518]. As a compressed point encoding representation is not defined for JWK elliptic curve points, the uncompressed point encoding defined there MUST be used. The "x" and "y" values represented MUST both be exactly 256 bits, with any leading zeros preserved. Other optional values such as "alg" MAY also be present.

It is represented in a COSE_Key [RFC8152] using these values:

*   "kty" (1): "EC2" (2)
*   "crv" (-1): "secp256k1" (8)

plus the values needed to represent the curve point, as defined in Section 13.1.1 of [RFC8152]. Either the uncompressed or compressed point encoding representations defined there can be used. The "x" value represented MUST be exactly 256 bits, with any leading zeros preserved. If the uncompressed representation is used, the "y" value represented MUST likewise be exactly 256 bits, with any leading zeros preserved; if the compressed representation is used, the "y" value is a boolean value, as specified in Section 13.1.1 of [RFC8152]. Other optional values such as "alg" (3) MAY also be present.

3.2. ECDSA Signature with secp256k1 Curve

The ECDSA signature algorithm is defined in [DSS]. This specification defines the "ES256K" algorithm identifier, which is used to specify the use of ECDSA with the secp256k1 curve and the SHA-256 [DSS] cryptographic hash function. Implementations need to check that the key type is "EC" for JOSE or "EC2" (2) for COSE and that the curve of the key is secp256k1 when creating or verifying a signature.

The ECDSA secp256k1 SHA-256 digital signature is generated as follows:

1. Generate a digital signature of the JWS Signing Input or the COSE Sig_structure using ECDSA secp256k1 SHA-256 with the desired private key. The output will be the pair (R, S), where R and S are 256-bit unsigned integers.

2. Turn R and S into octet sequences in big-endian order, with each array being 32 octets long. The octet sequence representations MUST NOT be shortened to omit any leading zero octets contained in the values.

3. Concatenate the two octet sequences in the order R and then S. (Note that many ECDSA implementations will directly produce this concatenation as their output.)

4. The resulting 64-octet sequence is the JWS Signature or COSE signature value.

Implementations SHOULD use a deterministic algorithm to generate the ECDSA nonce, k, such as the algorithm defined in [RFC6979]. However, in situations where devices are vulnerable to physical attacks, deterministic ECDSA has been shown to be susceptible to fault injection attacks [KUDELSKI17] [EURO-SP18]. Where this is a possibility, implementations SHOULD implement appropriate countermeasures. Where there are specific certification requirements (such as FIPS approval), implementors should check whether deterministic ECDSA is an approved nonce generation method.

The ECDSA secp256k1 SHA-256 algorithm specified in this document uses

these identifiers:

Name	Value	Description	Recommended
======	=======	=============	=============
ES256K	-47	ECDSA using secp256k1 curve and SHA-256	No

Table 2: ECDSA Algorithm Values

When using a JWK or COSE_Key for this algorithm, the following checks are made:

*   The "kty" field MUST be present, and it MUST be "EC" for JOSE or "EC2" for COSE.

*   The "crv" field MUST be present, and it MUST represent the "secp256k1" elliptic curve.

*   If the "alg" field is present, it MUST represent the "ES256K" algorithm.

*   If the "key_ops" field is present, it MUST include "sign" when creating an ECDSA signature.

*   If the "key_ops" field is present, it MUST include "verify" when verifying an ECDSA signature.

*   If the JWK "use" field is present, its value MUST be "sig".

3.3. Other Uses of the secp256k1 Elliptic Curve

This specification defines how to use the secp256k1 curve for ECDSA signatures for both JOSE and COSE implementations. While in theory the curve could also be used for ECDH-ES key agreement, it is beyond the scope of this specification to state whether this is or is not advisable. Thus, whether or not to recommend its use with ECDH-ES is left for experts to decide in future specifications.

When used for ECDSA, the secp256k1 curve MUST be used only with the "ES256K" algorithm identifier and not any others, including not with the COSE "ES256" identifier. Note that the "ES256K" algorithm identifier needed to be introduced for JOSE to sign with the secp256k1 curve because the JOSE "ES256" algorithm is defined to be used only with the P-256 curve. The COSE treatment of how to sign with secp256k1 is intentionally parallel to that for JOSE, where the secp256k1 curve MUST be used with the "ES256K" algorithm identifier.

4. IANA Considerations

4.1. COSE Algorithms Registrations

IANA has registered the following values in the "COSE Algorithms" registry [IANA.COSE.Algorithms].

```
Name:  RS256
Value:  -257
Description:  RSASSA-PKCS1-v1_5 using SHA-256
Change Controller:  IESG
Reference:  Section 2 of RFC 8812
Recommended:  No

Name:  RS384
Value:  -258
Description:  RSASSA-PKCS1-v1_5 using SHA-384
Change Controller:  IESG
Reference:  Section 2 of RFC 8812
Recommended:  No

Name:  RS512
Value:  -259
Description:  RSASSA-PKCS1-v1_5 using SHA-512
Change Controller:  IESG
Reference:  Section 2 of RFC 8812
Recommended:  No

Name:  RS1
Value:  -65535
Description:  RSASSA-PKCS1-v1_5 using SHA-1
Change Controller:  IESG
Reference:  Section 2 of RFC 8812
Recommended:  Deprecated

Name:  ES256K
Value:  -47
Description:  ECDSA using secp256k1 curve and SHA-256
Change Controller:  IESG
Reference:  Section 3.2 of RFC 8812
Recommended:  No
```

4.2. COSE Elliptic Curves Registrations

IANA has registered the following value in the "COSE Elliptic Curves" registry [IANA.COSE.Curves].

```
Name:  secp256k1
Value:  8
Key Type:  EC2
Description:  SECG secp256k1 curve
Change Controller:  IESG
Reference:  Section 3.1 of RFC 8812
Recommended:  No
```

4.3. JOSE Algorithms Registrations

IANA has registered the following value in the "JSON Web Signature and Encryption Algorithms" registry [IANA.JOSE.Algorithms].

```
Algorithm Name:  ES256K
Algorithm Description:  ECDSA using secp256k1 curve and SHA-256
Algorithm Usage Location(s):  alg
```

JOSE Implementation Requirements: Optional
        Change Controller: IESG
        Reference: Section 3.2 of RFC 8812
        Algorithm Analysis Document(s): [SEC2]

4.4. JSON Web Key Elliptic Curves Registrations

   IANA has registered the following value in the "JSON Web Key Elliptic
   Curve" registry [IANA.JOSE.Curves].

        Curve Name: secp256k1
        Curve Description: SECG secp256k1 curve
        JOSE Implementation Requirements: Optional
        Change Controller: IESG
        Specification Document(s): Section 3.1 of RFC 8812

5. Security Considerations

5.1. RSA Key Size Security Considerations

   The security considerations on key sizes for RSA algorithms from
   Section 6.1 of [RFC8230] also apply to the RSA algorithms in this
   specification.

5.2. RSASSA-PKCS1-v1_5 with SHA-2 Security Considerations

   The security considerations on the use of RSASSA-PKCS1-v1_5 with
   SHA-2 hash functions (SHA-256, SHA-384, and SHA-512) from Section 8.3
   of [RFC7518] also apply to their use in this specification. For that
   reason, these algorithms are registered as being "Not Recommended".
   Likewise, the exponent restrictions described in Section 8.3 of
   [RFC7518] also apply.

5.3. RSASSA-PKCS1-v1_5 with SHA-1 Security Considerations

   The security considerations on the use of the SHA-1 hash function
   from [RFC6194] apply in this specification. For that reason, the
   "RS1" algorithm is registered as "Deprecated". Likewise, the
   exponent restrictions described in Section 8.3 of [RFC7518] also
   apply.

   A COSE algorithm identifier for this algorithm is nonetheless being
   registered because deployed Trusted Platform Modules (TPMs) continue
   to use it; therefore, WebAuthn implementations need a COSE algorithm
   identifier for "RS1" when TPM attestations using this algorithm are
   being represented. New COSE applications and protocols MUST NOT use
   this algorithm.

5.4. secp256k1 Security Considerations

   Care should be taken that a secp256k1 key is not mistaken for a P-256
   [RFC7518] key, given that their representations are the same except
   for the "crv" value. As described in Section 8.1.1 of [RFC8152], we
   currently do not have any way to deal with this attack except to
   restrict the set of curves that can be used.

The procedures and security considerations described in the [SEC1], [SEC2], and [DSS] specifications apply to implementations of this specification.

Timing side-channel attacks are possible if the implementation of scalar multiplication over the curve does not execute in constant time.

There are theoretical weaknesses with this curve that could result in future attacks. While these potential weaknesses are not unique to this curve, they are the reason that this curve is registered as "Recommended: No".
