The Internet and the Millennium Problem (Year 2000)

Status of this Memo

   This memo provides information for the Internet community. It does
   not specify an Internet standard of any kind. Distribution of this
   memo is unlimited.

Abstract

   The Year 2000 Working Group (WG) has conducted an investigation into
   the millennium problem as it regards Internet related protocols.
   This investigation only targeted the protocols as documented in the
   Request For Comments Series (RFCs). This investigation discovered
   little reason for concern with regards to the functionality of the
   protocols. A few minor cases of older implementations still using
   two digit years (ala RFC 850) were discovered, but almost all
   Internet protocols were given a clean bill of health. Several cases
   of "period" problems were discovered, where a time field would "roll
   over" as the size of field was reached. In particular, there are
   several protocols, which have 32 bit, signed integer representations
   of the number of seconds since January 1, 1970 which will turn
   negative at Tue Jan 19 03:14:07 GMT 2038. Areas whose protocols will
   be effected by such problems have been notified so that new revisions
   will remove this limitation.

1. Introduction

   According to the trade press billions of dollars will be spend the
   upcoming years on the year 2000 problem, also called the millennium
   problem (though the third millennium will really start in 2001). This
   problem consists of the fact that many software packages and some
   protocols use a two-digit field for the year in a date field. Most of
   the problems seem to be in administrative and financial programs, or
   in the hardcoded microcomputers found in electronic equipment. A lot
   of organizations are now starting to make an inventory of which
   software and tools they use will suffer from the millennium problem.

With the increasing popularity of the Internet, more and more
organizations use the Internet as a serious business tool. This
means that most organizations will want to analyze the millennium
problems due to the use of Internet protocols and popular Internet
software. In the trade press the first articles suggest that the
Internet will collapse at midnight the 31st of December 1999.

To counter these suggestions, and to avoid having countless companies
redo the same investigation, this effort was undertaken by the IETF.
The Year 2000 WG has made an inventory of all-important Internet
protocols that have been documented in the Request for Comments (RFC)
series. Only protocols directly related to the Internet will be
considered.

This document is divided into a number of sections. Section 1 is the
Introduction which you are now reading. Section 2 is a disclaimer
about the completeness of this effort. Section 3 describes areas in
which millenium problems have been found, while Section 4 describes a
few other "period" problems. Section 5 describes potential fixes to
problems that have been identified. Section 6 describes the
methodology used in the investigation. Sections 7 through 22 are
devoted to the 15 different groupings of protocols and RFCs. Section
23 discusses security considerations, Section 24 is devoted to
references, and Section 25 is the author contact information.
Appendix A is the list of RFCs examined broken down by category.
Appendix B is a PERL program used to make a first cut identification
of problems, and Appendix C is the output of that PERL program.

The editor of this document would like to acknowledge the critical
contributions of the follow for direct performance of research and
the provision of text: Alex Latzko, Robert Elz, Erik Huizer, Gillian
Greenwood, Barbara Jennings, R.E. (Robert) Moore, David Mills, Lynn
Kubinec, Michael Patton, Chris Newman, Erik-Jan Bos, Paul Hoffman,
and Rick H. Wesson. The pace with which this group has operated has
only been achievable by the intimate familiarity of the contributors
with the protocols and ready access to the collective knowledge of
the IETF.

2. Disclaimer

This RFC is not complete. It is an effort to analyze the Y2K impact
on hundreds of protocols but is likely to have missed some protocols
and misunderstood others. Organizations should not attempt to claim
any legitimacy or approval for any particular protocol based on this
document. The efforts have concentrated on the identification of
potential problems, rather than solutions to any of the problems that
have been identified. Any proposed solutions are only that: proposed.
A formal engineering review should take place before any solution is

adopted.

It should also be noted that the research was performd on RFCs 1
through 2128. At that time the IESG was charted with not allowing
any new RFCs to be published that had any Year 2000 issues.   Since
that cutoff time there has been work to correct issues discovered by
this Working Group. In particular, RWhois as documented by RFC 1714
has been updated to fix the problems found. RFC 2167 now documents a
fixed version of the RWhois protocol. The work of this group was to
look backwards, and hence new RFC's which supplant the old are
expected to make the information in this RFC obsolete. The work of
this group will truly be complete when this document is completely
obsolete.

A number of people have suggested looking into other "special" dates.
For example, the first leap year, the first "double digit" day
(January 10, 2000), January 1, 2001, etc. There is not one place
where days have been used in the protocols defined by the RFC series
so there is little reason to believe that any of these special dates
will have any impact.

3. Summary of Year 2000 Problems

Here is a brief description of all the Millennium issues discovered
in the course of this research. Note that many of the RFCs are
unclear on the issue. They mandate the use of UTCTime but do not
specify whether the two-digit or four-digit year representation
should be used.

3.1 "Directory Services"

```
rfc1274.txt - References UTC date/time
rfc1276.txt - References UTC date/time for version control.
rfc1488.txt - References UTC Time as printable strings.
rfc1608.txt - Refers to uTCTimeSyntax
rfc1609.txt - Refers to uTCTimeSyntax
rfc1778.txt - Refers to uTCTimeSyntax
```

3.2 "Information Services and File Transfer"

HTTP 1.1, as defined in RFC 2068, requires all newly generated date
stamps to conform to RFC 1123 date formats which are Year 2000
compliant, but it also requires acceptance of the older non-compliant
RFC850 formats. Some specific recommendations have been passed to
the HTTP WG.

HTML 2.0, as defined in RFC 1866, could allow a very subtle Year 2000 problem, but once again this recommendation has been passed on the HTML WG.

RFC 1778 on String Representations of Standard Attribute Syntax's define UTC Time in Section 2.21 and uses that definition in Section 2.25 on User Certificates. Since UTC Time is being used, there is a potential millennium issue.

RFC 1440 on SIFT/UFT: Sender-Initiated/Unsolicited File Transfer defines an optional DATE command in Section 5 of the form mm/dd/yy which is subject to millennium issues.

3.3 "Electronic Mail"

After reviewing all mail-related RFCs, it was discovered that while some obsolete standards required two-digit years, all currently used standards require four-digit years and are thus not prone to typical Year 2000 problems.

RFCs 821 and 822, the main basis for SMTP mail exchange and message format, originally required two-digit years. However, both of these RFCs were later modified by RFC 1123 in 1989, which strongly recommended 4-digit years.

3.4 "Name Serving"

While not a protocol issue, there is a common habit of writing serial numbers for DNS zone files in the form YYXXXXXX. The only real requirement on the serial numbers is that they be increasing (see RFC 1982 for a complete description) and a change from 99XXXXXX to 00XXXXXX cause a failure. See the section on "Name Serving" for a complete description of the issues.

3.5 "Network Management"

Version 2 of SNMP's MIB definition language (SMIv2) specifies the use of UCTTimes for time stamping MIB modules. Even though these time stamps do not flow in any network protocols, there could be as issue with management applications, depending on implementations.

3.6 "Network News"

There does exist a problem in both NNTP, RFC 977, and the Usenet News Message Format, RFC 10336. They both specify two-digit year format. A working group has been formed to update the network news protocols in general, and addressing this problem is on their list of work items.

3.7 "Real-Time Services"

A Year 2000 problem does occur in the Simple Network Paging Protocol, versions 2 & 3. Both define a HOLDuntil option which uses a YYMMDDHHMMSS+/-GMT field. Version 3 also defines a MSTAtus command, which is required to store,dates and times as YYMMDDHHMMSS+/-GMT.

There is a small Year 2000 issue in RFC 1786 on the Representation of IP Routing Policies in the ripe-81++ Routing Registry. In Appendices C the "changed" object parameter defines a format of <email-address> YYMMDD, and similarly in Appendix D "withdrawn" object identifier has he format of YYMMDD. Since these are only identifiers there should be little operational impact. Some application software may need to be modified.

3.8 "Security"

RFC 1507 on Distributed Authentication Security Services (DASS) use UTCTime. Because of the imprecision of the UTC time definition there could be problems with this protocol.

RFCs 1421-1424 specifies that PEM uses UTC time formats which could have a Millennium issue.

4. Summary of Other "Periodicity" Problems

By far, the largest area of "period" problems occurs in the year 2038. Many protocols use a 32-bit field to record the number of seconds since January 1, 1970.

4.1 "Name Serivces"

DNS Security uses 32-bit timestamps which will roll over in 2038. This issue has been refered to the appropriate Working Group so that the details of rollover can be established.

4.2 "Routing"

IDPR suffers from the classic Year 2038 problem, by having a timestamp counter which rolls over at that time.

5. Suggested Solutions

The real solution to the problem is to use 4 digit year fields for applications and hardware systems. For counters that key off of a certain time (January 1, 1970 for example) need to either: define a wrapping solution, or to define a larger number space (greater than 32-bits), or to make more efficient use of the 32-bit space. However,

it will be impossible to completely replace currently deployed
systems, so solutions for handling problems are in order.

5.1 Fixed Solution

A number of organizations and groups have suggested a fixed solution
to the problem of two digit years. Given a two-digit year YY, if YY
is greater than or equal to 50, the year shall be interpreted as
19YY; and where YY is less than 50, the year shall be intrepreted as
20YY.

While a simple and straightforward solution, it only pushes the
problem off 40 to 50 years, until the artificially generated Year
2050 problem needs to be addressed. However, it is easy to implement
and deploy, so it might be the most commonly adopted solution.

5.2 Sliding Window

Another solution is the "sliding window" approach. In this approach,
some value N is selected, and any two digit year that is less than or
equal to the current two digit year plus N is considered the future,
while any other two digit year is considered in the past.

For example, choosing N equal to 10, If the current year is 2012,
and I get a two digit year that is any of 12, 13, 14, 15, 16, 17, 18,
19, 20, 21 or 22, assume it is 20YY (i.e. the future), otherwise
consider it to be in the past(1923-1999, 2000-2011).

This solution has two advantages. First, no new fixed year problems
are introduced. Second, different applications and protocols could
choose different values of N. The drawback is that this solution is
harder to implement, and to work well the value of N will need to be
constant across different implementations.

6. Methodology

The first task was dividing the types of RFC's into logical groups
rather than the strict numeric publishing order. Sixteen specific
areas were identified. They are: "Autoconfiguration" , "Directory
Services", "Disk Sharing", "Games and Chat" ,"Information Services &
File Transfer", "Network & Transport Layer", "Electronic Mail",
"NTP", Name Serving", "Network Management", "News", "Real Time
Services", "Routing", "Security", "Virtual Terminal", and "Other".
In addition to these categories, many hundreds of RFC's were
immediately eliminated based on content. That is not to say that all
Informational RFC's were not considered, many did contain some
technical content or overview whichdemanded scrutiny.

Each area was assigned to a team for investigation. Although each
team used whatever additional investigation techniques which seemed
appropriate (including completely reading each RFC, and in some cases
the source code for the reference implementation) at minimum each
team used an automatic scanning system to search for the following
items (case insensitively) in each RFC:

- date
- GMT
- UTCTime
- year
- yy (that is not part of yyyy)
- two-digit, 2-digit, 2digit
- century
- 1900 & 2000

Note that all of these strings except "UTCTime" may occur in
conjunction with a date format that accommodates the Year 2000
crossing, as well as with one that does not. So "hits" on these
string do not necessarily indicate Year 2000 problems: they simply
identify elements that need to be examined.

After the documents were scanned, therefore, each "hit" was examined
individually. Those that cause no Year 2000 problems (e.g., those
that encode the year as a two-byte integer, or as a four-character
display string) are not discussed here. Those that do cause Year
2000 problems are identified in this document, and the nature and
impact of the problems they cause are described.

7. Autoconfiguration

7.1 Summary

The RFC's which were categorized into this group were primarily the
BOOT Protocol (BOOTP) and the Dynamic Host Configuration Protocol
(DHCP) for both IP version four and six.

Examination of the BOOTP protocols and most popular implementations
show no year 2000 problems. All times are references as 32 bit
integers in seconds of UTC time. An investigation of all DHCP and
the IPv6 Autoconfiguration mechanisms produced no year 2000 problems.
All references to time, in particular lease lengths, are 32 bit
integers in seconds, allowing lease times of well over 100 years.

7.2 Specifics

The following RFCs were examined for possible millennium problems:
906, 951, 1048, 1084, 1395, 1497, 1531, 1532, 1533, 1534, 1541, 1542,
1970, & 1971. RFC 951's only reference to time or dates is a two-
byte field in the packet, which is number of second since the hosts,
was booted. RFC's 1048, 1084, 1395, 1497, 1531, & 1532 have either
no references to dates and time, or they are the same as the RFCs,
which obsoleted them, discussed in the next paragraph.

RFC 1533 enumerates all the known DHCP field types and a number of
these have to do with time. Section 3.4 defines a "Time Offset"
field which specifies the offset of the clients subnet in seconds
from UTC. This 4 byte field has no millennium issues. Section 9.2
defines the IP Address Lease Time field which is used by clients to
request a specific lease time. This four byte field is an unsigned
integer containing a number of seconds. Section 9.9 defines a
Renewal Time Value field, Section 9.10 defines a Rebinding Time
Value, both of which are similarly 32 bit fields, which have no
millennium issues.

RFC 1534 has no references to times or dates.

RFC 1541 has two mentions of times/dates. The first is the "secs"
field which, similarly to RFC 951, is a 16-bit field for the number
of seconds since the host has booted. There is also a discussion in
section 3.3 about "Interpretation and Representation of Time Values"
which while clearly states that there is no millennium or period
problems.

RFC 1542 also references the "secs" field mentioned previously.

RFC 1970 mentions a number of variables, which are time related. In
section 4.2 "Router Advertisement Message Format" the following
fields are defined: Router Lifetime, Reachable Time, & Retrans Timer.
In section 4.6.2 "Prefix Information" the following are defined:
Valid Lifetime, & Preferred Lifetime. In section 6.2.1 "Router
Configuration Variables the following are defined: MaxRtrAdvInterval,
MinRtrAdvInterval, AdvReachableTime, AdvRetransTimer,
AdvDefaultLifetime, AdvValidLifetime, & AdvPreferredLifetime. All of
these fields specify counters of some sort which have no millennium
or periodicity problems.

RFC 1971 has some discussion of preferred lifetimes, depreciated
lifetimes and valid lifetimes of leases, but only discusses them in
an expository way.

8. Directory Services

8.1 Summary

   The RFC's which were categorized into this group were primarily X.500
   related RFC's, Whois, Rwhois, Whois++, and the Lightweight Directory
   Access Protocol (LDAP).

   Upon review of the Directory Services related RFC's, no serious year
   2000 problems were discovered. Some minor issues were noted and
   explained below in the specific portion of this section.

8.2 Specifics

   RFCs that mentioned UTC Time or made reference to uTCTimeSyntax could
   fail to be Y2K compliant. These should be updated to specify the four
   year version of uTCTimeSyntax rather than giving the option of using
   a two-year date representation. The following RFCs fall into this
   category:

       rfc1274.txt - References UTC date/time
       rfc1276.txt - References UTC date/time for version control.
       rfc1488.txt - References UTC Time as printable strings.
       rfc1608.txt - Refers to uTCTimeSyntax
       rfc1609.txt - Refers to uTCTimeSyntax
       rfc1778.txt - Refers to uTCTimeSyntax

   Two RFC's have unusual date specifications and specify their own date
   format. Both of these support Y2K compliant dates.

   RFC1714 (RWhois) specifies date formats that are not Y2K compliant,
   but it also supports dates that are. Implementers of the RWhois
   protocol should only use the %MY4 format

   RFC1834 (Whois++) requires the use of dates, but it didn't specify
   the format, syntax, or representation of the date string to be used.

9. Disk Sharing

9.1 Summary

   The RFC's which were categorized into this group were those related
   to the Network File System (NFS). Other popular disk sharing
   protocols like SMB and AFS were referred to their respective
   trustee's for review.

   After careful review, NFS has no year 2000 problems.

9.2 Specifics

The references to time in this protocol are the times of file data
modification, file access, and file metadata change (mtime, atime,
and time, respectively). These times are kept as 32 bit unsigned
quantities in seconds since 1970-01-01, and so the NFS protocol will
not experience an Epoch event until the year 2106.

10. Games and Chat

10.1 Summary

The RFC's which were categorized into this group were related to the
Internet Relay Chat Protocol (IRC). No millennium problems exist in
the IRC protocol.

10.2 Specifics

There is only a single instance of time or date related information
in the IRC protocol as specified by RFC 1459. Section 4.3.4 defines
a TIME message type which queries a server for its local time. No
mention is made of the format of the reply or how it is parsed, the
assumption being specific implementations will handle the reply and
parse it appropriately.

11. Information Services & File Transfer

11.1 Summary

The RFC's which were categorized into this group were divided among
World Wide Web (WWW) protocols and File Transfer Protocols (FTP).
WWW protocols include the Hypertext Transfer Protocol (HTTP), a
variety of Uniform Resource formats (URL, URAs, etc.) and the
HyperText Markup Language(HTML). FTP protocols include the well
known FTP protocol, the Trivial File Transfer Protocol (TFTP) and a
variety of extensions to these protocols. Other information services
includes the Finger Protocol and the LPD protocol.

HTTP 1.1, as defined in RFC 2068, requires all newly generated date
stamps to conform to RFC 1123 date formats which are Year 2000
compliant, but it also requires acceptance of the older non-compliant
RFC850 formats. Some specific recommendations are listed below and
have been passed to the HTTP WG.

HTML 2.0, as defined in RFC 1866, could allow a very subtle Year 2000
problem, but once again this recommendation has been passed on the
HTML WG.

RFC 1778 on String Representations of Standard Attribute Syntax's
define UTC Time in Section 2.21 and uses that definition in Section
2.25 on User Certificates. Since UTC Time is being used, there is a
potential millennium issue.

RFC 1440 on SIFT/UFT: Sender-Initiated/Unsolicited File Transfer
defines an optional DATE command in Section 5 of the form mm/dd/yy
which is subject to millennium issues.

11.2 Specifics

The main IETF standards-track document on the HTTP protocol is
RFC2068 on HTTP 1.1. It notes that historically three different date
formats have been used, and that one of them uses a two-digit year
field. In section 3.3.1 it requires HTTP 1.1 implementations to
generate this RFC1123 format:

Sun, 06 Nov 1994 08:49:37 GMT ; RFC 822, updated by RFC 1123

instead of this RFC850 format:

Sunday, 06-Nov-94 08:49:37 GMT ; RFC 850, obsoleted by RFC 1036

Unfortunately, many existing servers, serving on the order of one
fifth of the current HTTP traffic, send dates in the ambiguous RFC850
format.

Section 19.3 of the RFC2068 says this:

o HTTP/1.1 clients and caches should assume that an RFC-850 date
   which appears to be more than 50 years in the future is in fact
   in the past (this helps solve the "year 2000" problem).

This avoids a "stale cache" problem, which would cause the user to
see out-of-date data.

RFC 1986 documents experiments with a simple file transfer program
over radio links using Enhanced Trivial FTP (ETFTP). There are a
number of timers defined which are all in seconds and have no year
2000 issues.

In RFC 1866, on HTML 2.0,the <META> tag allows the embedding of
recommended values for some HTTP headers, including Expires. E.g.

<META HTTP-EQUIV="Expires"
      CONTENT="Tue, 04 Dec 1993 21:29:02 GMT">

Servers should rewrite these dates into RFC1123 format if necessary.

RFC 1807 defines a format for bibliographic records and it specifies a DATE format, which requires 4 digit year fields.

RFC 1788 defines ICMP Domain Name messages. Section 3 defines a Domain Name Reply Packet, which contains a signed 32-bit integer. This timer is not Year 2000 reliant and is certainly large enough for it purposes.

RFC 1784 on TFTP Timeout Intervals and Transfer Size Options uses a field for the number of seconds for the timeout. It is an ASCII value from 1 to 255 octets in length. There is no Y2K issue.

RFC 1778 on String Representations of Standard Attribute Syntax's define UTC Time in Section 2.21 and uses that definition in Section 2.25 on User Certificates. Since UTC Time is being used, there is a potential millennium issue.

RFC 1777 on LDAP defines a timelimit in Section 4.3 which is expressed in seconds, but does not define any limits.

RFC 1440 on SIFT/UFT: Sender-Initiated/Unsolicited File Transfer defines an optional DATE command in Section 5 of the form mm/dd/yy, which is subject to millennium issues.

RFC 1068 on the Background File Transfer Protocol (BFTP) defines two commands in Sections B.2.12 and B.2.13, the Submit and Time commands. >From the example usage's given in Appendix C it is clear that this protocol will function correctly though the year 9999.

RFC 1037 on NFILE (a file access protocol) discusses the a Date representation in Section 7.1 as the number of seconds since January 1, 1900, but does not limit the field size. There should be no Y2K issues.

RFC 998 on NETBLT defines a Death time in Section 8, which is the sender's death time in seconds.

RFC 978 on the Voice File Interchange Protocol defines the Total Time of a message to be a 32-bit number of deci-seconds. This limits the size of a message but has no millennium issues.

RFC 969 was obsoleted by RFC 998.

RFC 916 defines the Reliable Asynchronous Transfer Protocol (RATP). Three timers are discussed in an expository manner in Section 5.4 and its subsections. There are no relevant issues.

RFCs 2122, 2056, 2055, 2054, 2044, 2016, 1960, 1959, 1874, 1865, 1862, 1843, 1842, 1823, 1815, 1808, 1798, 1785, 1783, 1782, 1779, 1766, 1738, 1737, 1736, 1729, 1728, 1727, 1639, 1633, 1630, 1625, 1554, 1545, 1530, 1529, 1528, 1489, 1486, 1436, 1415, 1413, 1350, 1345, 1312, 1302, 1288, 1278, 1241, 1235, 1196, 1194, 1179, 1123, 1003, 971, 965, 959, 949, 913, 887, 866, 865, 864, 863, 862, 797, 795, 783, 775, 765, 751, 743, 742, 740, 737, 725, 722, 707, 691, 683, 662, 640, 624, 614, 607, 599, 412, 411, 410, 407, and 406 were found to have no references to dates or times, and hence no millennium issues.

RFCs 712, 697, 633, 630, 622, 610, 593, 592, 589, 573, 571, 570, 553, 551, 549, 543, 535, 532, 525, 520, 514, 506, 505, 504, 501, 499, 493, 490, 487, 486, 485, 480, 479, 478, 477, 472, 468, 467, 463, 454, 451, 448, 446, 438, 437, 436, 430, 429, 418, 414, and 409 were not available for review.

RFCS below 400 were considered too obsolete to even consider.

12. Network & Transport Layer

12.1 Summary

The RFC's which were categorized into this group were the Internet Protocol (IP) versions four and six, the Transmission Control Protocol (TCP), the User Datagram Protocol (UDP), the Point-to-Point Protocol (PPP) and its extensions, Internet Control Message Protocol (ICMP), the Address Resolution Protocol (ARP) and Remote Procedure Call (RPC) protocol. A variety of less known protocols were also examined.

After careful review of the nearly 400 RFC's in this catagory, no millennium or year 2000 problems were found.

12.2 Specifics

RFC 2125 on the PPP Bandwidth Allocation Protocol (BAP) in section 5.3 discusses the use if mandatory timers, but gives no mention as to how they are implemented.

RFC 2114 on a Data Link Switching Client Access Protocol defines a retry timer of five seconds in Section 3.4.1.

RFC 2097 on the PPP NetBIOS Frame Control Protocol discuesses several timer and timeouts in Section 2.1, none of which suffers from a year 2000 problem.

RFC 2075 on the IP Echo Host Service discusses timestamps and has no millennium issues.

RFC 2005 on the Applicability for Mobile IP discusses using
timestamps as a security measure to avoid replay attacks (Section
3.), but does not quantify them. There are no expected issues.

RFC 2002 on IP Mobility Support uses a 16-bit field for the lifetime
of a connection and notes the 18.2 hour limitation that this imposes.
Section 5.6.1 on replay protection requires the use of 64-bit time
fields, of a similar format to NTP packets.

RFC 1981 on Path MTU Discovery for IPv6 discusses timestamps and
their potential use to purge stale information in section 5.3. There
is no millennium issues in this use.

RFC 1963 on the PPP Serial Data Transport Protocol defines a flow
expiration time in section 4.9 which has no year 2000 issues.

RFC 1833 on Binding Protocols for ONC RPC Version 2 defines a
variable in Section 2.2.1 called RPCBPROC_GETTIME which returns the
local time in seconds since 1/1/1970. Since this value is not fields
width dependent, it may or may not wrap around the 32-bit value
depending on the operating system parameters.

RFC 1762 on the PPP DECnet Phase IV Control Protocol discusses a
number of timers in Section 5 (General Considerations). None of
these timers experience any millennium issues.

RFC 1761 on Snoop Version 2 Packet Capture File Format discusses two
32-bit timestamp values on Section 4 on Packet Record Formats. The
first of these may wrap in the year 2038, but should not effect
anything of any import.

RFC 1755 on ATM Signalling Support for IP Over ATM discusses timing
issues in Section 3.4 on VC Teardown. These limited timers have no
year 2000 issues.

RFC 1692 on the Transport Multiplexing Protocol (TMux) defines a TTL
in Section 2.3 and a timer in Section 3.3. Neither of these suffer
from any millennium or year 2000 issues.

RFC 1661 on PPP defines three timers in Section 4.6, none of which
have any year 2000 issues.

RFC 1644 on T/TCP (TCP Extensions for Transactions) mentions RFC 1323
and the extended timers recommended in it.

RFC 1575 defines an echo function for CNLP discusses in the narrative
the use of the Lifetime Field in Section 5.3. There is nothing to
suggest that there is any year 2000 issues.

   RFC 1329 on Dual MAC FDDI Networks discusses ARP cache administration
   in Section 9.3 and 9.4 and various timers to expire entries.

   RFC 1256 on ICMP Router Discovery Messages talks about lifetime
   fields in Section 2 and defines three router configuration variables
   in Section 4.1. None of these have any millennium issues.

   RFC 792 on ICMP discusses Timestamps and Timestamp Reply messages
   which define a 32-bit timestamp which contains the number of
   milliseconds since midnight UT.

   RFC 791 on the Internet Protocol defines a packet type 68 which is an
   Internet Timestamp, which defines a 32-bit field which contains the
   number of milliseconds since midnght UT.

   RFC 781 was defines the same option which is codified in RFC 791 as a
   packet type 68.

   RFC's 2126, 2118, 2113, 2107, 2106, 2105, 2098, 2067, 2043, 2023,
   2019, 2018, 2009, 2004, 2003, 2001, 1994, 1993, 1990, 1989, 1979,

   91, 80, 79, 70, 67, 65, 62, 60, 59, 56, 55, 54, 53, 41, 38, 33, 23,
   22, 20, 19, 17, 12 were deemed too old to be considered for millennium
   investigation.

13. Electronic Mail

13.1 Summary

   The RFC's which were categorized into this group were the Simple Mail
   Transfer Protocol (SMTP), Internet Mail Access Protocol (IMAP), Post
   Office Protocol (POP), Multipurpose Internet Mail Exchange (MIME),
   and X.400 to SMTP interaction.

   After reviewing all mail-related RFCs, it was discovered that while
   some obsolete standards required two-digit years, all currently used
   standards require four-digit years and are thus not prone to typical
   Year 2000 problems.

13.2 Specifics

   RFCs 821 and 822, the main basis for SMTP mail exchange and message
   format, originally required two-digit years. However, both of these
   RFCs were later modified by RFC 1123 in 1989, which strongly
   recommended 4-digit years. Although there might be a few very old
   SMTP systems using two-digit years, it is believed that almost all
   mail sent over the Internet today uses four-digit years. Mail that
   contains two-digit years in its SMTP headers will not "fail", but
   might be mis-sorted in message stores and mail user agents. This
   problem is avoided entirely by taking the RFC 1123 change as a
   requirement, rather than merely as a recommendation.

   IMAP versions 1, 2, and 3 used two-digit years, but IMAP version 4
   (defined in RFCs 1730 and 1732 in 1994) requires four-digit years.
   There are still a few IMAP 2 servers and clients in use on the
   Internet today, but IMAP version 4 has already taken over almost all
   of the IMAP market. Mail stored on an IMAP server or client with
   two-digit years will not "fail", but could possibly be mis-sorted or
   prematurely expired.

   RFC 1153 describes a format for digests of mailing lists, and uses
   two-digit dates. This format is not widely used. The use of two-digit
   dates could possibly cause missorting of stored messages.

RFC 1327, which describes mapping between X.400 mail and SMTP mail, uses the UTCTime format.

RFC 1422 describes the structure of certificates that were used in PEM (and are expected to be used in many other mail and non-mail services). Those certificates use dates in UTCTime format. Poorly written software might prematurely expire or validate a certificate based on comparisons of the date with the current date, although no current software is known to do this.

14. Network Time Protocols

14.1 Summary

The RFC's which were categorized into this group were the Network Time Protocol (NTP), and the Time Protocol.

NTP has been certified year 2000 compliant, while the Time Protocol will "roll over" at Thu Feb 07 00:54:54 2036 GMT. Since NTP is the current defacto standard for network time this does not seem to be an issue.

14.2 Specifics

There is no reference anywhere in the NTP specification or implementation to any reference epoch other than 1 January 1900. In short, NTP doesn't know anything about the millennium.

>From the Time Protocol RFC (868):

    S: Send the time as a 32 bit binary number.

    ...

    The time is the number of seconds since 00:00 (midnight) 1 January
    1900 GMT, such that the time 1 is 12:00:01 am on 1 January 1900
    GMT; this base will serve until the year 2036.

15. Name Services

15.1 Summary

The RFC's which were categorized into this group were the Domain Name System (DNS), it's advanced add on features (Incremental Zone Transfer, etc.).

There have been no year 2000 relayed problems found with the DNS protocols, or common implementations of them.

15.2 Specifics

One is a common practice of writing serial numbers in zone files as
if they represent a date, and using only two digits of the year.
That practice cannot survive into the year 2000. This is not a
protocol problem, the serial number is simply an integer, and any
value is OK, provided it always increases (see rfc1982 for a
definition of what that means). In any case, a change from 97abcd
(or similar) to 00abcd would be a decrease and so is not permitted.
Zone file maintainers have two choices, one easy (though irrational)
one would be to continue from 99 to 100 and so on. The other, is
simply to switch, at any time between now and when the serial number
first needs updating after the year 2000, to use 4 digits to
represent the year instead of 2. As long as there are no more than 6
digits in the "abcd" part, and this is done sometime before the year
2100, this is always an increase, and therefore always safe. Should
any zone files be of the form yyabcdefg (with 7 digits after a 2-
digit year) then the procedures of section 7 of rfc2182 should be
adopted to convert the serial number to some other value.

The other item of note is related to timestamps in DNS security.
Those are represented as 32 bit counts of seconds, based in 1970, and
hence have no year 2000 problems. however, they do obviously have a
natural end of life, and sometime before that time is reached, the
definitions of those fields need to be corrected, perhaps to allow
them to represent the number of seconds elapsed since the base,
modulo 2^32, which is likely to be adequate for the purposes of DNS
security (signatures and keys are unlikely to need to be valid for
more than 70 years). In any case, more work is needed in this area
in the not too far distant future.

16 Network Management

16.1 Summary

The RFC's which were categorized into this group were the Simple
Network Management Protocol (SNMP), a large number of Management
Information Bases (MIBs) and the Common Management Information
Protocol over TCP/IP (CMOT).

Although a few discrepancies have been found and outlined below, none
of them should have an impact on interoperability.

16.2 Specifics

16.2.1 Use of GeneralizedTime in CMOT as defined in RFCs 1095 and
1189.

The standards for CMOT specify an unusual use for the GeneralizedTime
type. (GeneralizedTime has a four-digit representation of the year.)

If the system generating the PDU does not have the current time, yet
does have the time since last boot, then GeneralizedTime can be used
to encode this information. The time since last boot will be added
to the base time "0001 Jan 1 00:00:00.00" using the Gregorian
calendar algorithm.

This is really a "Year 0" problem rather than a Year 2000 problem,
and in any case, CMOT is not currently deployed.

16.2.2 UTCTime in SNMP Definitions

UTCTime is an ASN.1 type that includes a two-digit representation of
the year. There are several options for UTCTime in ASN.1, that vary
in precision and in local versus GMT, but these options all have
two-digit years. The standards for SNMP definitions specify one
particular format:

        YYMMDDHHMMZ

The first usage of UTCTime in the standards for SNMP definitions goes
all the way back to RFC 1303. It has persisted unchanged up through
the current specifications in RFC 1902. The role of UTCTime in SNMP
definitions is to record the history of an SNMP MIB module in the
module itself, via two ASN.1 macros:

    o   LAST-UPDATED
    o   REVISION

Management applications that store and use MIB modules need to be
smart about interpreting these UTCTimes, by prepending a "19" or a
"20" as appropriate.

16.2.3 Objects in the Printer MIB (RFC 1559)

There are two objects in the Printer MIB that allow use of a date as
an object value with no explicit guidance for formatting the value.
The objects are prtInterpreterLangVersion and prtInterpreterVersion.
Both are defined with a syntax of OCTET STRING. The descriptions for
the objects allow the object value to contain a date, version code or
other product specific information to identify the interpreter or
language. The descriptions do not include an explicit statement
recommending use of a four-digit year when a date is used as the
object value.

16.2.4 Dates in Mobile Network Tracing Records (RFC 2041)

   The RFC specifies trace headers and footers with date fields that are
   character arrays of size 32. While 32 characters certainly provide
   enough room for a four-digit year, there's no explicit statement that
   these years must be represented with four digits.

17 Network News

17.1 Summary

   The RFC's which were categorized into this group were related to the
   Network News Protocol (NNTP).

   There does exist a problem in both NNTP, RFC 977, and the Usenet News
   Message Format, RFC 10336. They both specify two-digit year format.
   A working group has been formed to update the network news protocols
   in general, and addressing this problem is on their list of work
   items.

17.2 Specifics

   The NNTP transfer protocols defined in RFC 977. Sections 3.7.1, the
   definition of the NEWGROUPS command, and 3.8.1, the NEWNEWS command,
   that dates must be specified in YYMMDD format.

   The format for USENET news messages is defined in RFC 1036. The Date
   line is defined in section 2.1.2 and it is specified in RFC-822
   format. It specifically disallows the standard UNIX ctime(3) format,
   which would allow for four digit years. Section 2.2.4 on Expires
   also mandates the same two-digit year format.

18. Real Time Services

18.1 Summary

   The RFC's which were categorized into this group were related to IP
   Multicast, RTP, and Internet Stream Protocol. A Year 2000 problem
   does occur in the Simple Network Paging Protocol, versions 2 & 3.
   Both define a HOLDuntil option which uses a YYMMDDHHMMSS+/-GMT field.
   Version 3 also defines a MSTAtus command, which is required to store,
   dates and times as YYMMDDHHMMSS+/-GMT.

18.2 Specifics

   RFC 2102 discusses Multicast support for NIMROD and has no mention of
   dates or time. RFC 2090 on TFTP Multicast options is also free from
   any date/time references.

RFC 2038 on RTP MPEG formats has three references to time: a
Presentation Time Stamp (PTS), a Decoding Time Stamp (DTS), and a
System Clock (SC) reference time. Each RTP packet contains a
timestamp derived from the sender 90 kHz clock reference. Each of
the header fields are defined in section 2.1, 3, and 3.3 are 32 bit
fields. No mention is made of a "zero" start time, so it is presumed
that this format will be valid until at least 2038.

Similarly RFC 2035 on the RTP JPEG format defines the same timestamp
in section 3. RFC 2032 on RTP H.261 video streams uses a calculated
time based on the original frame so once again there is no millennium
issue. RFC 2029 on the RTP format for Sun's CellB video encoding
mentions the RTP timestamp in section 2.1.

RFC 2022 defines support for multicast over UNI 3.0/3.1 based ATM
networks. Section 5. defines a timeout value for connections
between one and twenty minutes. Section 5.1.1 discusses several
timers that are bound between five and ten seconds, while 5.1.3
requires an inactivity timer, which should also run between one and
twenty minutes. Sections 5.1.5, 5.1.5.1, 5.1.5.2, 5.2.2, 5.4, 5.4.1,
5.4.2, 5.4.3, 6.1.3 and Appendix E all defines numerous timers, none
of which have any millennium issues.

RFC 1890 on RTP profiles for audio and video conferences discusses a
sampling frequency which has no issues. RFC 1889 on RTP discusses
time formats in section 4, as the same 64 bit unsigned integer format
that NTP uses. There is a "period" problem, which will occur in the
year 2106. Section 5.1 is a more formalized discussion of the
timestamp properties, while Section 6.3.1 discusses a variety of
different timers all using the 64 bit field format, or a compressed
32-bit version of the inner octet of bytes. Section 8.2 discusses
loop detection and how the various timers are used to determine if
looping occurs.

RFC 1861 on Version 3 of the Simple Network Paging Protocol does have
a Year 2000 problem. The protocol defines a HOLDuntil command in
section 4.5.6 and a MSTAtus command in section 4.6.10, both of which
require dates/times to be stored as YYMMDDHHMMSS+/-GMT. Clearly this
format will be invalid after the end of 1999.

RFC 1821 has no date/time references. RFC 1819 on Version 2 of the
Internet Stream Protocol defines a HELLO message format in section
6.1.2, which does contain a timer which is updated every millisecond.
No year 2000 problems exist with this protocol.

RFC 1645 on Version 2 of the Simple Network Paging Protocol contains
the same HOLDuntil field problem as version 3. The definition is
contained section 4.4.6.

RFC 1458 on the Requirements of Multicast Protocols discusses a
retransmission timer in section 4.23. and a general discussion of
timer expiration in section 5, neither of which have any millennium
concerns. RFC 1301 on the Multicast Transport Protocol defines a
heartbeat interval of time in section 2.1, as well as retention and
windows. Formal definitions for each are contained in sections
2.2.7, 2.2.8 and 2.2.9. The heartbeat is a 32 bit unsigned field,
while the Window and Retention are both 16 bit unsigned fields.
Section 3.4.2 gives examples values for these fields, which indicate
no millennium issues.

RFC 1193 on Client Requirements for Real Time Services talks about
time in section 4.4, but there are no Year 2000 issues. RFC 1190
have been obsoleted by RFC 1819, but the hello timer issues are
similar.

RFCs 1789, 1768, 1703, 1614, 1569, 1568, 1546, 1469, 1453, 1313,
1257, 1197, 1112, 1054, 988, 966, 947, 809, 804, 803, 798, 769, 741,
511, 508, 420, 408 and 251 contain no date or time references.

19. Routing

19.1 Summary

The RFC's which were categorized into this group were Routing
Information Protocol (RIP), the Open Shortest Path First (OSPF)
protocol, Classless InterDomain Routing (CIDR),the Border Gateway
Protocol (BGP), and the InterDomain Routing Protocol (IDRP).

After careful examination both BGP and RIP have been found Year 2000
compliant.

There is a small Year 2000 issue in RFC 1786 on the Representation of
IP Routing Policies in the ripe-81++ Routing Registry. In Appendices
C the "changed" object parameter defines a format of <email-address>
YYMMDD, and similarly in Appendix D "withdrawn" object identifier has
he format of YYMMDD. Since these are only identifiers there should
be little operational impact. Some application software may need to
be modified.

IDPR suffers from the classic Year 2038 problem, by having a
timestamp counter which rolls over at that time.

19.2 Specifics

RFC 2091 on Extensions to RIP to Support Demand Circuits defines
three required and one optional timers in section 6. The Database
Timer (6.1), the Hold down Timer (6.2), the Retransmission Time (6.3)

and the Over-Subscription Timer (6.4) are all counters, which have no
millennium, issues. RFC 2081 on the applicability of RIPng discusses
deletion of routes for a variety of issues, one of which is the
garbage- collection timer exceeds 120 seconds. There are no Year
2000 issues. RFC 2080 on RIPng for IPv6, discusses various times in
section 2.6, none of which have any millennium problems.

RFC 1987 on Ipsilon's General Switch Management protocol there is a
Duration field defined in section 4, which has no relevant problems.
Section 8.2 defines the procedure for dealing with timers. RFC 1953
on Ipsilon's Flow Management Specification for IPv4 defines the same
procedure in section 3.2, as well as a lifetime field in the Redirect
Message (Section 4.1). There are no millennium issues in either
case.

There is a small Year 2000 issue in RFC 1786 on the Representation of
IP Routing Policies in the ripe-81++ Routing Registry. In Appendices
C the "changed" object parameter defines a format of <email-address>
YYMMDD, and similarly in Appendix D "withdrawn" object identifier has
he format of YYMMDD. Since these are only identifiers there should
be little operational impact. Some application software may need to
be modified.

RFC 1771 defines the Border Gateway Protocol (BGP). BGP does not
have knowledge of absolute time, only relative time. There are five
timers defined: Hold Timer, ConnectRetry Timer, KeepAlive Timer,
MinRoueAdvertisementInterval and MinASOriginationInterval. There are
no known issues regarding BGP and the millennium.

In RFC 1584, which defines Multicast Extensions to OSPF, three timers
are defined in section 8.2: IGMPPollingInterval, IGMPTimeout, and
IGMP polling timer. Section 8.4 defines an age parameter for the
local groups database and section 9.3 outlines how to implement that
age parameter. It is not expected that any connections lifetime will
be long enough to cause any issues with these timers.

RFC 1583, OSPF, there are two types of timers defined in section 4.4,
single-shot timers and interval timers. There are a number of timers
defined in Section 9 including: HelloInterval, RouterDeadInterval,
InfTransDelay, Hello Timer, Wait Timer and RxmtInterval. Section 10
also defines the Inactivity Timer. No millennium problem exists for
any of these timers.

RFC 1582 is an earlier version of RFC 2091. Section 7 documents the
same timers as noted above, with the same lack of a millennium issue.

RFC 1504 on Appletalk Update-Based Routing Protocol defines a 10-
second period in Section 3, and hence has no relevant issues.

RFC 1479 which specifies IDPR Version 1, defines a timestamp field in
section 1.5.1, which is a 32 bit unsigned integer number of seconds
since January 1, 1970. The authors recognize the problem of
timestamp exhaustion in 2038, but feel that the protocol will not be
in use for that period. Sections 1.7, 2.1, and 4.3.1 also discuss
the timestamp field. RFC 1478 on the IDPR Architecture, also
discusses the same timestamp field in section 3.3.4. RFC 1477 again
refers to the IDPR timestamp in section 4.2. Thus IDPR has no Year
2000 issue, but does have a period problem in the year 2038.

RFC 1075 on Distance Vector Multicast Routing Protocol devotes
section 7 to time values. None of the timers have any millennium
issues. RFC 1074, on the NFSNET backbone SPF IGP defines several
hardcoded timers values in section 5.

RFC 1058 on RIP discusses the 30-second timers in section 3.3. There
is no millennium issues related to RIP.

RFC 995 on the Requirements for Internet Gateways has extensive
discussions of timers in section 7.1 and throughout A.1 and A.2.
None of these timers suffer from the millennium problem.

RFC 911 on EGP on Berkeley Unix recommend timer values of 30 and 120
seconds.

RFC 904 which defines the Exterior Gateway Protocol (EGP). There are
a number of timers discussed in sections 4.1.1 and 4.1.4. None of
these timers suffer from any relevant problems.

RFCs 2103, 2092, 2073, 2072, 2042, 2008, 1998, 1997, 1992, 1966, 1955,
1940, 1930, 1925, 1923, 1863, 1817, 1812, 1793, 1787, 1774, 1773,
1772, 1765, 1753, 1745, 1723, 1722, 1721, 1716, 1702, 1701, 1668,
1656, 1655, 1654, 1587, 1586, 1585, 1581, 1520, 1519, 1517, 1482,
1476, 1439, 1403, 1397, 1388, 1387, 1383, 1380, 1371, 1370, 1364,
1338, 1322, 1268, 1267, 1266, 1265, 1264, 1254, 1246, 1245, 1222,
1195, 1164, 1163, 1142, 1136, 1133, 1126, 1125, 1124,1104, 1102, 1092,
1009, 985, 981, 975, 950, 898, 890, 888, 875, and 823 contain no date
or time references.

20. Security

20.1 Summary

The RFC's which were categorized into this group were kerberos
authentication protocol, Remote Authentication Dial In User Service
(RADIUS), One Time Password System (OTP), Privacy Enhanced Mail
(PEM), security extensions to a variety of protocols including (but
not limited to) RIPv2, HTTP, MIME, PPP, IP, Telnet and FTP.

Encryption and authentication algorithms are also examined.

RFC 1507 on Distributed Authentication Security Services (DASS) discusses time and secure time in an expository manner in Sections 1.2.2, 1.4.4 and 2.1. Section 3.6 defines absolute time as an UTC time with a precision of 1 second, and Section 4.1 discusses ANS.1 encoding of time values. Because of the imprecision of the UTC time definition there could be problems with this protocol.

RFCs 1421-1424 specifies that PEM uses UTC time formats which could have a Millennium issue since the year specification only provides the last two digits of the year.

20.2 Specifics

RFC 2082 on RIP-2 MD5 Authentication requires storage of security keys for a specified lifetime in sections 4.1 and 4.2. There are no millennium issues in this protocol.

RFC 2078 on the GSSAPI Version 2 defines numerous calls that use timers for inputs and outputs. Sections 2.1.1, 2.1.3, 2.1.4, 2.1.5, 2.2.1, 2.2.2, 2.2.5 and 2.2.6 all use the lifetime_rec field, which is defined as an integer counter in seconds. There should be no relevant problems with this protocol.

RFC 2069 on Digest Authentication for HTTP, defines a 'date' and a 1123 formats which is not subject to millennium issues. Section 3.2 discusses dates and times in the context of thwarting replay attacks, but have no relevant issues.

RFC 2065 on DNS Security extensions first discusses time in section 2.3.3. The SIG RDATA format is defined in Section 4.1 discusses "time signed" field and defines it to be a 32 bit unsigned integer number of seconds since January 1, 1970. There will be a period problem in 2038 because of rollover. Section 4.5 on the file representations of SIG RRs specifies the time field is expressed as YYYYMMDDHHMMSS which is clearly Year 2000 compliant.

RFC 2059 on RADIUS account formats defines a "time" attribute, which is optional which is a 32 bit unsigned integer number of seconds since January 1, 1970. Likewise RFC 2058 on RADIUS also defines this optional attribute in the same way. There will be a potential period problem that occurs on 2038.

RFC 2035 on the Simple Public Key GSSAPI Mechanism talks about secure timestamps in the background and overview sections only in an expository manner.

RFC 1969 on the PPP DES Encryption Protocol uses time as an example
in Section 4 when discussing how to encrypt the first packet of a
stream. It is suggested that the first 32 bits be used for the
number of seconds since January 1, 1970. There could thus be a
potential operations problem in 2038.

RFC 1898 on the CyberCash Credit Card Protocol provides an example
message in Section 2.7 which uses a date field of the form
YYYYMMDDHHMM that is clearly Y2K compliant.

RFC 1510, which defines Kerberos Version 5, makes extensive use of
times in the security model. There are discussions in the
Introduction, as well as Sections 1.2, and 3.1.3. Kerberos uses
ASN.1 definitions to abstract values, and hence defines a base
definition for KerberosTime which is a generalized time format in
Section 5.2. >From the text: "Example: The only valid format for UTC
time 6 minutes, 27 seconds after 9 p.m. on 6 November 1985 is
19851106210627Z." A side note is that the MIT reference
implementation of the Kerberos, by default set the expiration of
tickets to December 31, 1999. This is not protocol related but could
have some operational impacts.

RFC 1509 on GSSAPI C-bindings makes a single reference that all
counters are in seconds and assigned as 32 bit unsigned integers.
Hence GSSAPI mechanisms may have problems in 2038.

RFC 1507 on Distributed Authentication Security Services (DASS)
discusses time and secure time in an expository manner in Sections
1.2.2, 1.4.4 and 2.1. Section 3.6 defines absolute time as an UTC
time with a precision of 1 second, and Section 4.1 discusses ANS.1
encoding of time values. Because of the imprecision of the UTC time
definition there could be problems with this protocol.

RFC 1424 on PEM Part IV defines a self-signed certificate request in
Section 3.1. The validity period start and end times are both
suggested to be January 1, 1970. RFC 1422 on PEM Part II defines the
validity period for a certificate in Section 3.3.6. It is
recommended that UTC Time formats are used, and notes the lack of a
century so that comparisons between different centuries must be done
with care. No suggestions on how to do this are included. Sections
3.5.2 also discusses validity period in PEM CRLs. RFC 1421 on PEM
Part I discusses validity periods in an expository way. PEM as a
whole could have problems after December 31, 1999 based on its use of
UTC Time.

RFCs 1113, 1114, and 1115 specify the original version of PEM and
have been obsoleted bye 1421, 1422, 1423, & 1424.

   RFCs 2104, 2085, 2084, 2057, 2040, 2015, 1984, 1968, 1964, 1961, 1949,
   1948, 1938, 1929, 1928, 1858, 1852, 1851, 1829, 1828, 1827, 1826,
   1825, 1824, 1760, 1751, 1750, 1704, 1675, 1579, 1535, 1511, 1492,
   1457, 1455, 1423, 1416, 1412, 1411, 1409, 1408, 1321, 1320, 1319,
   1281, 1244, 1186, 1170, 1156, 1108, 1004, 972, 931, 927, 912, and 644
   contain no date or time references.

21. Virtual Terminal

21.1 Summary

   The RFC's which were categorized into this group were Telnet and its
   many extensions, as well as the Secure SHell (SSH) protocol. The X
   window system was not considered since it is not an IETF protocol.
   Official acknowledgement by the trustee's of the X window system was
   given that they will examine the protocol.

   Unencrypted Telnet and TN3270 have both been found to be Year 2000
   Compliant. The SSH protocols are also Year 2000 compliant.

   ## 21.2 Specifics

   RFC 1013 on the X Windows version 11 alpha protocol defines are 32
   bit unsigned integer timestamp in Section 4.

   RFCs 2066, 1647, 1576, 1572, 1571, 1372, 1282, 1258, 1221, 1205, 1184,
   1143, 1116, 1097, 1096, 1091, 1080, 1079, 1073, 1053, 1043, 1041,
   1005, 946, 933, 930, 929, 907, 885, 884, 878, 861, 860, 859, 858, 857,
   856, 855, 854, 851, 818, 802, 782, 779, 764, 749, 748, 747, 746, 736,
   735, 734, 732, 731, 729, 728, 727, 726, 721, 719, 718, 701, 698, 658,
   657, 656, 655, 654, 653, 652, 651, 647, 636, 431, 399, 393, 386, 365,
   352, 340, 339, 328, 311, 297, 231, and 215 contain no date or time
   references.

   RFCs 703, 702, 688, 679, 669, 659, 600, 596, 595, 587, 563, 562, 560,
   559, 513, 495, 470, 466, 461, 447, 435, 377, 364, 318, 296, 216, 206,
   205, 177, 158, 139, 137, 110, 97 were unavailable.

22. Other

22.1 Summary

   This grouping was a hodge-podge of informational RFCs, April Fool's
   Jokes, IANA lists, and experimental RFCs. None were found to have
   any millennium issues.

22.2 Specifics

RFCs 2123, 2036, 2014, 2000, 1999, 1958, 1935, 1900, 1879, 1855, 1822,
1814, 1810, 1799, 1776, 1718, 1715, 1700, 1699, 1640, 1627, 1610,
1607, 1601, 1600, 1599, 1594, 1580, 1578, 1574, 1550, 1540, 1539,
1527, 1499, 1463, 1462, 1438, 1410, 1402, 1401, 1391, 1367, 1366,
1360, 1359, 1358, 1349, 1340, 1336, 1325, 1324, 1300, 1291, 1287,
1261, 1250, 1249, 1206, 1200, 1199, 1177, 1175, 1174, 1152, 1149,
1140, 1135, 1127, 1118, 1111, 1100, 1099, 1077, 1060, 1039, 1020,
1019, 999, 997, 992, 990, 980, 960, 945, 944, 943, 939, 909, 902, 900,
899, 873, 869, 846, 845, 844, 843, 842, 840, 839, 838, 837, 836, 835,
834, 833, 832, 831, 820, 817, 800, 776, 774, 770, 766, 762, 758, 755,
750, 745, 717, 637, 603, 602, 590, 581, 578, 529, 527, 526, 523, 519,
518, 496, 491, 432, 404, 403, 401, 372, 363, 356, 345, 330, 329, 327,
317, 316, 313, 295, 282, 263, 242, 239, 234, 232, 225, 223, 213, 209,
204, 198, 195, 173, 170, 169, 167, 154, 149, 148, 147, 140, 138, 132,
131, 130, 129, 126, 121, 112, 109, 107, 100, 95, 90, 68, 64, 57, 52,
51, 46, 43, 37, 27, 25, 21, 15, 10, and 9 were examined and none were
found to have any date or time references, let alone millennium or Year
2000 issues.

23. Security Considerations

Although this document does consider the implications of various
security protocols, there is no need for additional security
considerations. The effect of a potential year 2000 problem may
cause some security problems, but those problems are more of specific
applications rather than protocol deficiencies introduced in this
document.

24. References

Because of the exhaustive nature of this investigation, the reader is
referred to the list of published RFC's available from the IETF
Secretariat or the RFC Editor, rather than republishing them here.

Appendix A: List of RFC's for each Area

   The following list contains the RFC's grouped by area that were
   searched for year 2000 problems.

   Each line contains three fields are separated by '::'. The first
   filed is the RFC number, the second field is the type of RFC (S =
   Standard, DS = Draft Standard, PS = Proposed Standard, E =
   Experimental, H = Historical, I = Informational, BC = Best Current
   Practice, '' = No Type), and the third field is the Title.

Appendix B: Automatic Script to Implement Methodology

```perl
#!/usr/bin/perl

# Program to read text files (such as RFCs and Internet Drafts) and
#    output items that might relate to year 2000 issues, particularly
#    2-digit years.

# Version 1.1a. Slight modification by Philip J. Nesser
#    (phil@nesser.com) to split lines from old RFC's that are
#    too wide to conform with current RFC standards.

# Version 1.1. By Paul Hoffman (phoffman@imc.org). This is a
#    quick-and-dirty hack and could be written more elegantly and
#    more efficiently. There may be bugs in this software. For
#    example, there was an off-by-one-line bug in version 1.0.
#    Use this code at your own risk. This code may be freely
#    redistributed.

# Some people like using disk files, others like STDIN and STDOUT.
#    This program accomodates both types by setting the $UsageType
#    variable. 'file' means input comes from the first argument on
#    the command line, output goes to that filename with a ".out"
#    extension; 'std' means STDIN and STDOUT.
$UsageType = 'file';  # Should be 'file' or 'std'

# @CheckWords is a list of words to look for. This list is used in
#    addition to the automatic checking for "yy" on a line without "YYYY".
#    You might want to add "year yyyy" to this list, but then a large
#    proportion of the RFCs and drafts get selected

@CheckWords = qw(UTCTime two-digit 2-digit 2digit century 1900 2000);

if($UsageType eq 'file') {
        if($ARGV[0] eq '')
                { die "You must specify the name of the file to open.\n" }
        $InName = $ARGV[0];
        unless(-r $InName) { die "Could not read $InName.\n" }
        open(IN, $InName) or die "Could not open $InName.\n";
        $OutName = "$InName.out";
        open(OUT, ">$OutName") or die "Could not write to $OutName.\n";
        $OutStuff = '';  # Holder for what we're going to print out
} else {  # Do STDIN and STDOUT
        open(IN, "-"); open(OUT, ">-");
}

# Read the whole file into an array. This is a tad wasteful of memory
#    but makes the output easier.
```

```
@All = ();

Appendix D: Discussion of HTTP 1.0 Issues

    HTTP:

    The main IETF standards-track document on the HTTP protocol is
    RFC2068 on HTTP 1.1. It notes that historically three different date
    formats have been used, and that one of them uses a two-digit year
    field. In section 3.3.1 it requires HTTP 1.1 implementations to
    generate this RFC1123 format:

        Sun, 06 Nov 1994 08:49:37 GMT ; RFC 822, updated by RFC 1123

    instead of this RFC850 format:

            Sunday, 06-Nov-94 08:49:37 GMT ; RFC 850, obsoleted by RFC
        1036

    Unfortunately, many existing servers, serving on the order of one
    fifth of the current HTTP traffic, send dates in the ambiguous RFC850
    format.

Section 19.3 of the RFC2068 says this:

> o HTTP/1.1 clients and caches should assume that an RFC-850 date
>   which appears to be more than 50 years in the future is in fact
>   in the past (this helps solve the "year 2000" problem).

This avoids a "stale cache" problem, which would cause the user to
see out-of-date data.

But to avoid unnecessary delays and bandwidth indicated in Scenario 2
below, this should be extended to say that a date which appears to be
more than 50 years in the past may be assumed to be in the future, if
a future date is legal for that field.

Scenario 3 indicates that servers may also want to follow these
rules.

 Here is some more background and justification for these arguments.

The following headers use full dates:

```
HTTP/1.0:
        Date:
        Expires:                   # can be in the future
        If-Modified-Since:         # required to be in the past
        Last-Modified:             # required to be in the past
        Retry-After:               # can be in the future, also takes
                                       # relative time - number of seconds

HTTP/1.1:
        If-Range:
        If-Unmodified-Since:    # required to be in the past
```

Note that clock skew between hosts can lead to confusion here - see
the RFC for details.

Here are some scenarios of the implications of RFC850 dates, which
include stale caches, unnecessary requests for things, which are
validly cached, delays for the user, extra bandwidth, and presenting
incorrect information to the user.

Some cases involve comparisons with the current time, and others may
involve comparisons between dates from different sources. The
abbreviation "/99" is used to imply an RFC850 date with the value
"99" for the year.

RFC850 date from server

Scenario 1:
>   If a client gets an Expires /99 date after the year 2000, it
>   should interpret it as 1999, to avoid ending up with a stale
>   cache entry.
>
>   This is as already specified in RFC2068.

Scenario 2:
>   If a client gets an Expires /00 date before the year 2000,
>   and subsequently is faced with a choice to either retrieve
>   the document from its cache or look for an updated copy, it
>   may interpret it as the year 2000, to avoid the unnecessary
>   delay and bandwidth of an extra request.

RFC850 date from client

Scenario 3:
>   If a server gets an If-Modified-Since /99 date from a client
>   after the year 2000, it should interpret it as 1999 when
>   comparing with the local modification date, in order to
>   possibly avoid sending a full GET response rather than a HEAD
>   response.
>
>   Note that an If-Modified-Since header must never be in the
>   future.
