                    Management Information Base
                        for Version 2 of the
           Simple Network Management Protocol (SNMPv2)

Status of this Memo

Table of Contents

1. Introduction

A management system contains: several (potentially many) nodes, each
with a processing entity, termed an agent, which has access to
management instrumentation; at least one management station; and, a
management protocol, used to convey management information between
the agents and management stations. Operations of the protocol are
carried out under an administrative framework which defines
authentication, authorization, access control, and privacy policies.

Management stations execute management applications which monitor and
control managed elements. Managed elements are devices such as
hosts, routers, terminal servers, etc., which are monitored and
controlled via access to their management information.

Management information is viewed as a collection of managed objects,
residing in a virtual information store, termed the Management
Information Base (MIB). Collections of related objects are defined
in MIB modules. These modules are written using a subset of OSI's
Abstract Syntax Notation One (ASN.1) [1], termed the Structure of
Management Information (SMI) [2].

The management protocol, SNMPv2 [3], provides for the exchange of
messages which convey management information between the agents and
the management stations. It is the purpose of this document to
define managed objects which describe the behavior of a SNMPv2
entity.

1.1. A Note on Terminology

For the purpose of exposition, the original Internet-standard Network
Management Framework, as described in RFCs 1155 (STD 16), 1157 (STD
15), and 1212 (STD 16), is termed the SNMP version 1 framework
(SNMPv1). The current framework is termed the SNMP version 2
framework (SNMPv2).

    DESCRIPTION
            "The MIB module for SNMPv2 entities."
    REVISION        "9304010000Z"
    DESCRIPTION
            "The initial revision of this MIB module was published as
            RFC 1450."
    ::= { snmpModules 1 }

snmpMIBObjects OBJECT IDENTIFIER ::= { snmpMIB 1 }

--  ::= { snmpMIBObjects 1 }        this OID is obsolete
--  ::= { snmpMIBObjects 2 }        this OID is obsolete
--  ::= { snmpMIBObjects 3 }        this OID is obsolete

-- the System group
--
-- a collection of objects common to all managed systems.

system    OBJECT IDENTIFIER ::= { mib-2 1 }

sysDescr OBJECT-TYPE
    SYNTAX        DisplayString (SIZE (0..255))
    MAX-ACCESS  read-only
    STATUS        current
    DESCRIPTION
            "A textual description of the entity.  This value should
            include the full name and version identification of the
            system's hardware type, software operating-system, and
            networking software."
    ::= { system 1 }

sysObjectID OBJECT-TYPE
```

```
    SYNTAX       OBJECT IDENTIFIER
    MAX-ACCESS  read-only
    STATUS       current
    DESCRIPTION
            "The vendor's authoritative identification of the network
            management subsystem contained in the entity.  This value is
            allocated within the SMI enterprises subtree (1.3.6.1.4.1)
            and provides an easy and unambiguous means for determining
            `what kind of box' is being managed.  For example, if vendor
            `Flintstones, Inc.' was assigned the subtree
            1.3.6.1.4.1.4242, it could assign the identifier
            1.3.6.1.4.1.4242.1.1 to its `Fred Router'."
    ::= { system 2 }

sysUpTime OBJECT-TYPE
    SYNTAX       TimeTicks
    MAX-ACCESS  read-only
    STATUS       current
    DESCRIPTION
            "The time (in hundredths of a second) since the network
            management portion of the system was last re-initialized."
    ::= { system 3 }

sysContact OBJECT-TYPE
    SYNTAX       DisplayString (SIZE (0..255))
    MAX-ACCESS  read-write
    STATUS       current
    DESCRIPTION
            "The textual identification of the contact person for this
            managed node, together with information on how to contact
            this person.  If no contact information is known, the value
            is the zero-length string."
    ::= { system 4 }

sysName OBJECT-TYPE
    SYNTAX       DisplayString (SIZE (0..255))
    MAX-ACCESS  read-write
    STATUS       current
    DESCRIPTION
            "An administratively-assigned name for this managed node.
            By convention, this is the node's fully-qualified domain
            name.  If the name is unknown, the value is the zero-length
            string."
    ::= { system 5 }

sysLocation OBJECT-TYPE
    SYNTAX       DisplayString (SIZE (0..255))
    MAX-ACCESS  read-write
```

        STATUS   current
        DESCRIPTION
                "The physical location of this node (e.g., `telephone
                closet, 3rd floor'). If the location is unknown, the value
                is the zero-length string."
        ::= { system 6 }

sysServices OBJECT-TYPE
        SYNTAX   INTEGER (0..127)
        MAX-ACCESS read-only
        STATUS   current
        DESCRIPTION
                "A value which indicates the set of services that this
                entity may potentially offers. The value is a sum. This
                sum initially takes the value zero, Then, for each layer, L,
                in the range 1 through 7, that this node performs
                transactions for, 2 raised to (L - 1) is added to the sum.
                For example, a node which performs only routing functions
                would have a value of 4 ($2^{(3-1)}$). In contrast, a node
                which is a host offering application services would have a
                value of 72 ($2^{(4-1)} + 2^{(7-1)}$). Note that in the context
                of the Internet suite of protocols, values should be
                calculated accordingly:

                        layer   functionality
                         1   physical (e.g., repeaters)
                         2   datalink/subnetwork (e.g., bridges)
                         3   internet (e.g., supports the IP)
                         4   end-to-end (e.g., supports the TCP)
                         7   applications (e.g., supports the SMTP)

                For systems including OSI protocols, layers 5 and 6 may also
                be counted."
          ::= { system 7 }

   EMail: kzm@cisco.com

5. Acknowledgements

   This document is the result of significant work by the four major
   contributors:

   Jeffrey D. Case (SNMP Research, case@snmp.com)
   Keith McCloghrie (Cisco Systems, kzm@cisco.com)
   Marshall T. Rose (Dover Beach Consulting, mrose@dbc.mtview.ca.us)
   Steven Waldbusser (International Network Services, stevew@uni.ins.com)

   In addition, the contributions of the SNMPv2 Working Group are
   acknowledged. In particular, a special thanks is extended for the
   contributions of:

     Alexander I. Alten (Novell)
     Dave Arneson (Cabletron)
     Uri Blumenthal (IBM)
     Doug Book (Chipcom)
     Kim Curran (Bell-Northern Research)
     Jim Galvin (Trusted Information Systems)
     Maria Greene (Ascom Timeplex)
     Iain Hanson (Digital)
     Dave Harrington (Cabletron)
     Nguyen Hien (IBM)
     Jeff Johnson (Cisco Systems)
     Michael Kornegay (Object Quest)
     Deirdre Kostick (AT&T Bell Labs)
     David Levi (SNMP Research)
     Daniel Mahoney (Cabletron)
     Bob Natale (ACE*COMM)
     Brian O'Keefe (Hewlett Packard)
     Andrew Pearson (SNMP Research)
     Dave Perkins (Peer Networks)
     Randy Presuhn (Peer Networks)
     Aleksey Romanov (Quality Quorum)
     Shawn Routhier (Epilogue)
     Jon Saperia (BGS Systems)

Bob Stewart (Cisco Systems, bstewart@cisco.com), chair
Kaj Tesink (Bellcore)
Glenn Waters (Bell-Northern Research)
Bert Wijnen (IBM)
