                        Definitions of Managed Objects
                    for the DS0 and DS0 Bundle Interface Type

Status of this Memo

Copyright Notice

Abstract

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in the Internet community.
   In particular, it describes objects used for managing DS0 and DS0
   Bundle interfaces. This document is a companion document with
   Definitions of Managed Objects for the DS1/E1/DS2/E2 (RFC 2495 [17]),
   DS3/E3 (RFC 2496 [18]), and the work in progress, SONET/SDH Interface
   Types.

   This memo specifies a MIB module in a manner that is both compliant
   to the SNMPv2 SMI, and semantically identical to the peer SNMPv1
   definitions.

Table of Contents

1.   The SNMP Management Framework

The SNMP Management Framework presently consists of five major
components:

   o   An overall architecture, described in RFC 2271 [1].

   o   Mechanisms for describing and naming objects and events for the
        purpose of management. The first version of this Structure of
        Management Information (SMI) is called SMIv1 and described in
        STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The
        second version, called SMIv2, is described in RFC 1902 [5], RFC
        1903 [6] and RFC 1904 [7].

   o   Message protocols for transferring management information. The
        first version of the SNMP message protocol is called SNMPv1 and
        described in STD 15, RFC 1157 [8]. A second version of the SNMP
        message protocol, which is not an Internet standards track
        protocol, is called SNMPv2c and described in RFC 1901 [9] and
        RFC 1906 [10]. The third version of the message protocol is
        called SNMPv3 and described in RFC 1906 [10], RFC 2272 [11] and
        RFC 2274 [12].

   o   Protocol operations for accessing management information. The
        first set of protocol operations and associated PDU formats is
        described in STD 15, RFC 1157 [8]. A second set of protocol
        operations and associated PDU formats is described in RFC 1905
        [13].

   o   A set of fundamental applications described in RFC 2273 [14] and
        the view-based access control mechanism described in RFC 2275
        [15]. Managed objects are accessed via a virtual information
        store, termed the Management Information Base or MIB. Objects
        in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIv2.
A MIB conforming to the SMIv1 can be produced through the
appropriate translations. The resulting translated MIB must be
semantically equivalent, except where objects or events are
omitted because no translation is possible (use of Counter64).
Some machine readable information in SMIv2 will be converted
into textual descriptions in SMIv1 during the translation
process. However, this loss of machine readable information is
not considered to change the semantics of the MIB.

2. Overview

These objects are used when the particular media being used to
realize an interface is a DS0 interface. At present, this applies to
these values of the ifType variable in the Internet-standard MIB:

    ds0 (81)
    ds0Bundle (82)

2.1. BONDing Terminology

Please reference The BONDing Spec [20] for definitions of terms used
to describe bonding modes.

2.2. Use of ifTable for DS0 Layer

The following items are defined in RFC 2233 [16].

Only the ifGeneralInformationGroup and ifCounterDiscontinuityGroup
need to be supported.

ifTable Object	Use for DS0 Layer
================	===================
ifIndex	Interface index.
ifDescr	See interfaces MIB [16].
ifType	ds0(81) or ds0Bundle(82).
ifSpeed	64000 for ds0 (regardless of the setting of robbed bit signalling) or N*64000 for ds0Bundle.
ifPhysAddress	The value of the Circuit Identifier. If no Circuit Identifier has been assigned this object should have an octet string with zero length.

             ifAdminStatus   See interfaces MIB [16].

             ifOperStatus   See interfaces MIB [16].

             ifLastChange   See interfaces MIB [16].

             ifName   See interfaces MIB [16].

             ifLinkUpDownTrapEnable Set to disabled(2).
                                    Supports read-only access.

             ifHighSpeed   Set to rounded ifSpeed/1000000.

             ifConnectorPresent   Set to false(2).

2.3. Using ifStackTable

   This section describes by example how to use ifStackTable to
   represent the relationship of ds0 and ds0Bundles with ds1 interfaces.
   Implementors of the stack table for ds0 and ds0Bundle interfaces
   should look at the appropriate RFC for the service being stacked on
   ds0s and ds0Bundles. Examples given below are for illustration
   purposes only.

   Example: A Frame Relay Service is being carried on 4 ds0s of a ds1.
```
          +---------------------+
          | Frame Relay Service |
          +---------------------+
                     |
          +---------------------+
          | ds0Bundle           |
          +---------------------+
           |     |     |     |
          +---+ +---+ +---+ +---+
          |ds0| |ds0| |ds0| |ds0|
          +---+ +---+ +---+ +---+
           |     |     |     |
          +---------------------+
          | ds1                 |
          +---------------------+
```

   The assignment of the index values could for example be:

          ifIndex   Description
          1   FrameRelayService (type 44)
          2   ds0Bundle   (type 82)
   3   ds0 #1   (type 81)

```
            4          ds0 #2             (type 81)
            5          ds0 #3             (type 81)
            6          ds0 #4             (type 81)
            7          ds1                (type 18)
```

The ifStackTable is then used to show the relationships between the
various interfaces.

```
        ifStackTable Entries

        HigherLayer    LowerLayer
        0              1
        1              2
        2              3
        2              4
        2              5
        2              6
        3              7
        4              7
        5              7
        6              7
        7              0
```

In the case where the frameRelayService is using a single ds0, then
the ds0Bundle is not required.

```
        +----------------------+
        | Frame Relay Service  |
        +----------------------+
           |
        +---+
        |ds0|
        +---+
           |
        +----------------------+
        | ds1                  |
        +----------------------+
```

The assignment of the index values could for example be:

```
        ifIndex   Description
        1         FrameRelayService (type 44)
        2         ds0                (type 81)
        3         ds1                (type 18)
```

The ifStackTable is then used to show the relationships between the
various interfaces.

        ifStackTable Entries

        HigherLayer   LowerLayer
        0   1
        1   2
        2   3
        3   0

2.3.1. Usage of Channelization for DS3, DS1, DS0

   An example is given here to explain the channelization objects in the
   DS3, DS1, and DS0 MIBs to help the implementor use the objects
   correctly. Treatment of E3 and E1 would be similar, with the number
   of DS0s being different depending on the framing of the E1. Timeslot
   16 is not created for framing types that do not pass data over it.

   Assume that a DS3 (with ifIndex 1) is channelized into DS1s (without
   DS2s). The object dsx3Channelization is set to enabledDs1. There
   will be 28 DS1s in the ifTable. Assume the entries in the ifTable
   for the DS1s are created in channel order and the ifIndex values are
   2 through 29. In the DS1 MIB, there will be an entry in the
   dsx1ChanMappingTable for each ds1. The entries will be as follows:

        dsx1ChanMappingTable Entries

        ifIndex   dsx1Ds1ChannelNumber   dsx1ChanMappedIfIndex
        1   1   2
        1   2   3
        ......
        1   28   29

   In addition, the DS1s are channelized into DS0s. The object
   dsx1Channelization is set to enabledDs0 for each DS1. When this
   object is set to this value, 24 DS0s are created by the agent. There
   will be 24 DS0s in the ifTable for each DS1. If the
   dsx1Channelization is set to disabled, the 24 DS0s are destroyed.

   Assume the entries in the ifTable are created in channel order and
   the ifIndex values for the DS0s in the first DS1 are 30 through 53.
   In the DS0 MIB, there will be an entry in the dsx0ChanMappingTable
   for each DS0. The entries will be as follows:

dsx0ChanMappingTable Entries

ifIndex	dsx0Ds0ChannelNumber	dsx0ChanMappedIfIndex
2	1	30
2	2	31
......		
2	24	53

2.3.2. Usage of ifIndex Mapping for DS0Bundle

An example is given here to explain the ifIndex mapping objects in
the DS0Bundle MIB to help the implementor use the objects correctly.

Assume that a DS1 (with ifIndex 1) is channelized into DS0s. There
will be 24 DS0s in the ifTable. Assume the entries in the ifTable
for the DS0s are created in channel order and the ifIndex values are
2 through 25. Now, assume that there are two bundles on the DS1.
The first one uses channels 1 and 2. The second uses channels 3 and
4. There will be two ifTable entries for these bundles, with values
of 26 and 27 for ifIndex. There will be an entry in the
dsx0BundleTable for each bundle. The entries will be as follows:

dsx0BundleTable Entries

dsx0BundleIndex	dsx0BundleIfIndex
1	26
2	27

There will be an entry in the dsx0ConfigTable for each DS0. The
entries will be as follows:

dsx0ConfigTable Entries

ifIndex	dsx0Ds0ChannelNumber	dsx0Ds0BundleMappedIfIndex
2	1	26
3	2	26
4	3	27
5	4	27
6	5	0
7	6	0
......		
25	24	0

3. Overview of the MIB

This document contains 2 MIB modules, the DS0 MIB and the DS0Bundle
MIB.

3.1. DS0 MIB

   The DS0 MIB is used to represent individual DS0s in a DS1 or E1.
   Variables in this MIB would be created for each DS0 in the ifTable.
   This MIB contains the following group:

   The DS0 Config Group - This group contains configuration information
   about a particular DS0.

3.2. DS0Bundle MIB

   The DS0Bundle MIB is used to represent collections of DS0s that are
   used together to carry data within a DS1/E1 at speeds greater than
   that of a single DS0. DS0Bundles are created on top of DS0s and are
   represented that way in the ifStackTable. This MIB contains the
   following groups:

   The DS0 Bundle Group - This group contains objects used for creating
   new ds0Bundles. This group is mandatory.

   The DS0 Bonding Group - This group contains information about bonding
   for a ds0Bundle, if bonding is enabled. This group is optional.

4. Object Definitions for DS0

   DS0-MIB DEFINITIONS ::= BEGIN

    MAX-ACCESS  read-write
    STATUS  current
    DESCRIPTION
            "This object determines if the idle and seized
            codes are transmitted. If the value of this object
            is true then the codes are transmitted."
    ::= { dsx0ConfigEntry 7 }

dsx0Ds0BundleMappedIfIndex OBJECT-TYPE
    SYNTAX InterfaceIndexOrZero
    MAX-ACCESS  read-only
    STATUS  current
    DESCRIPTION
            "This object indicates the ifIndex value assigned
            by the agent for the ds0Bundle(82) ifEntry to
```

                which the given ds0(81) ifEntry may belong.

                If the given ds0(81) ifEntry does not belong to
                any ds0Bundle(82) ifEntry, then this object has a
                value of zero.

                While this object provides information that can
                also be found in the ifStackTable, it provides
                this same information with a single table lookup,
                rather than by walking the ifStackTable to find
                the possibly non-existent ds0Bundle(82) ifEntry
                that may be stacked above the given ds0(81)
                ifTable entry."
        ::= { dsx0ConfigEntry 8 }

    -- The DS0 Channel Mapping Table

    dsx0ChanMappingTable OBJECT-TYPE
        SYNTAX   SEQUENCE OF Dsx0ChanMappingEntry
        MAX-ACCESS not-accessible
        STATUS   current
        DESCRIPTION
                "The DS0 Channel Mapping table. This table maps a
                DS0 channel number on a particular DS1/E1 into an
                ifIndex."
        ::= { ds0 3 }

    dsx0ChanMappingEntry OBJECT-TYPE
        SYNTAX   Dsx0ChanMappingEntry
        MAX-ACCESS not-accessible
        STATUS   current
        DESCRIPTION
                "An entry in the DS0 Channel Mapping table. There
                is an entry in this table corresponding to each
                ds0 ifEntry within any interface that is
                channelized to the individual ds0 ifEntry level.

                This table is intended to facilitate mapping from
                channelized interface / channel number to DS0
                ifEntry. (e.g. mapping (DS1 ifIndex, DS0 Channel
                Number) -> ifIndex)

                While this table provides information that can
                also be found in the ifStackTable and
                dsx0ConfigTable, it provides this same information
                with a single table lookup, rather than by walking
                the ifStackTable to find the various constituent
                ds0 ifTable entries, and testing various

```
                dsx0ConfigTable entries to check for the entry
                with the applicable DS0 channel number."

      --   DS0 Bundle Table

      --   The DS0 Bundle Table

```
dsx0BundleNextIndex OBJECT-TYPE
    SYNTAX   TestAndIncr
    MAX-ACCESS  read-write
    STATUS   current
    DESCRIPTION
            "This object is used to assist the manager in
            selecting a value for dsx0BundleIndex.  Because
            this object is of syntax TestAndIncr (see the
            SNMPv2-TC document, RFC 1903) it can also be used
            to avoid race conditions with multiple managers
            trying to create rows in the table.

            If the result of the SET for dsx0BundleNextIndex
            is not success, this means the value has been
            changed from index (i.e. another manager used the
            value), so a new value is required.

            The algorithm is:
            done = false
            while done == false
                index = GET (dsx0BundleNextIndex.0)
                SET (dsx0BundleNextIndex.0=index)
                if (set failed)
                  done = false
                else
                  SET(dsx0BundleRowStatus.index=createAndGo)
                  if (set failed)
                    done = false
                  else
                    done = true
                    other error handling"

       MAX-ACCESS  read-create
       STATUS  current
       DESCRIPTION
               "This object indicates which BONDing mode is used,
               if any, for a ds0Bundle.  Mode0 provides parameter
               and number exchange with no synchronization.  Mode
               1 provides parameter and number exchange.  Mode 1
               also provides synchronization during
               initialization but does not include inband
               monitoring.  Mode 2 provides all of the above plus
               inband monitoring.  Mode 2 also steals 1/64th of
               the bandwidth of each channel (thus not supporting
               n x 56/64 kbit/s data channels for most values of
               n). Mode 3 provides all of the above, but also
               provides n x 56/64 kbit/s data channels.  Most
               common implementations of Mode 3 add an extra
               channel to support the inband monitoring overhead.
               ModeNone should be used when the interface is not
               performing bandwidth-on-demand."

9. Security Considerations

SNMPv1 by itself is such an insecure environment. Even if the
network itself is secure (for example by using IPSec), even then,
there is no control as to who on the secure network is allowed to
access and GET (read) the objects in this MIB.

It is recommended that the implementors consider the security
features as provided by the SNMPv3 framework. Specifically, the use
of the User-based Security Model RFC 2274 [12] and the View-based
Access Control Model RFC 2275 [15] is recommended.

It is then a customer/user responsibility to ensure that the SNMP
entity giving access to an instance of this MIB, is properly
configured to give access to those objects only to those principals
(users) that have legitimate rights to access them.

Setting the following objects to an inappropriate value can cause
loss of traffic. In the case of dsx0RobbedBitSignalling, for
example, the nature of the traffic flowing on the DS0 can be
affected.
    dsx0RobbedBitSignalling
    dsx0IdleCode
    dsx0SeizedCode
    dsx0TransmitCodesEnable
    dsx0BundleRowStatus
    dsx0BondMode
    dsx0BondRowStatus

Setting the following objects is mischievous, but not harmful to
traffic.
    dsx0CircuitIdentifier
    dsx0BundleNextIndex
